Got my new radio yesterday. Ordered mine on Thanksgiving Day. Recieved two notices when it shipped, one from Ed and one from stamps.com . Loaded the software today. I'm running windows 7. Following the manual I clicked start, typed usb, and clicked on usb to com port. It comes up and gives choice of modify, repair, delete. Clicked modify and driver would not load, said ini file would not load. I rebooted, this time clicked remove, then rebooted, then clicked modify again; it took a little longer this time and then said it loaded sucessfully. It said to reboot and I did, and after reboot I plugged in the cable and ran the software. No problems. Read the radio fine. I put 3 screen shots of the software in the photo sections. I will start programming now. I would like to make a screen shot of the software pages with some explanations of the functions and options and what they mean as we figure them out, especially the ones that are not clear in the manual.

So far, it remains a mystery. You can substitute
by using the hyper channel feature.

Drove through downtown St Louis enroute to work this morning

RF Squelch set @ S-5 S-9 too much. Squelch set at 6….even had Gain Antenna in place

Pretty tolerable.

Going to continue playing…can do this a bit more on the fly now so will continue to play and find the optimal settings

But with a few days to shake out things…think I'm going to be happy. Now just need to find a good mount for the remote head.

I refer to it as intermod. Intermodulation Distortion or IMD.

It's where a strong signal takes the receiver front end

out of linear operation allowing other signals to intermix

and creates harmonic spurs both below and above the

main signals. If you are hearing things other than what

you should be hearing on a frequency this is likely the cause.

You could also be hearing ACI Adjacent Channel Interference.

Same goes with Crosstalk. And all can be caused by poor filtering

or shielding, tuning etc..

Received radio yesterday and impressesed with its construction. While becoming familiar with the radio noticed that the mic PTT was intermittent. When it did work and key the radio it would not unkey when PTT was released. Tried a RESET but that did not correct the problem.
Looking for suggestions before I bother Ed.

I had the same problem. Open the mic and you will find a rubber part between the PTT button and the switch. Reinstall it properly and it will work.

I think you will find some compromises and be
a happy camper. I don't care for the RF squelch
with the firmware update. My old stock 5888
acted differently on RF squelch, more to my liking.
I've found carrier squelch pretty decent set at halfway
'10'. I use a Comet CSB 750A. 3.6 db on 2 meters
and 6.1 db on 440. At home I use a Cushcraft AR270B
30 feet in the air. I think it has one more DB gain
per band than the Comet. I don't get any intermod
at all around here. But the radio does create it's own
signals that interfere with each side depending upon
the channel being UHF and VHF and only while scanning.
One side has to be receiving VHF and not scanning, the other
has to be scanning a combination of UHF and VHF and the
main side has to be the VHF stationary side. If the channel
becomes active the scanning side while make a slight click
as the other side scans the UHF channels. It's an annoyance
and if you switch the main side to the scanning side the clicking
is almost gone. Now, on the older 5888 with older firmware
the clicking was not tolerable and I had to use the radio
with the sub band disabled.

Yeah if you can get away with just a unity gain half wave
on each band that would be ideal. I know around here where
I can go to be in an RF rich environment. There's a hill with
a dozen towers on it and I know who owns some of the gear.
It's got pagers, LTR, conventional law enforcement on 155
and 460 repeaters and some other stuff that I don't know
who owns it and what it is but it looks like digital trunked,
maybe a multi-agency digital repeater on 855.
He'll give me the key to the fence then I can sit underneath
all that crap and see what it means to me in a real situation.
I've already done simulations in the shop using a General Dynamics
R8000 test set, spec analyzer and know I can force intermod out
of the radio. But it took a lot of signal, maybe -60 dBm to
force the receiver out of linear operations and get some low
amplitude spurs adjacent to the main two injection frequencies.
And the receivers are hot, still heard test tone at -127 dBm.
The R8000 only goes as low as -130 dBm.

John

Not entirely sure what you mean by “You should take a look at the mount on the radio- easy to remove and it fits the head perfectly.”

I’m currently using a phone holder turned horizontally but the pieces that extend to the rear of the head for placing in the radio body make it difficult to get the proper grip.

I'm thinking John means that the mount on the
radio body can be removed from the radio body.
Looks like it is just a plastic shell probably
very similar to what Anytone is now offering.
And the radio would function normally without
this plastic docking bracket that is attached to the
radio body. Does that make sense ? LOL!

John
Not entirely sure what you mean by “You should take a look at the mount on the radio- easy to remove and it fits the head perfectly.”

I’m currently using a phone holder turned horizontally but the pieces that extend to the rear of the head for placing in the radio body make it difficult to get the proper grip.

There is a mount coming but don't have time frame. I mounted mine to a beanbag type GPS dash mount using a piece of aluminum and velcro to stick the head to the aluminum. You should take a look at the mount on the radio- easy to remove and it fits the head perfectly.

Yup…and probably makes sense with my current holder as it would have a flat surface to grip.

May have to try that this weekend

I looked at your screenshots for the programming software for the Anytone and one thing I saw right off the bat was this: That is the exact format and layout for my rig. Now there are probably differences which allow the wideband programming whereas mine is just vhf.

I use a Blackbox VHF (part 90) mobile radio which is built for Klein Electronics.

Little chance your radio would work with the Anytone software.
It checks the firmware for the radio identity. And there are two
versions of the software. One will only work with the newest
firmware equipped 5888UV's while the older software will
not work with the newer firmware only the older firmware
radios.

Milton,
Have you talked to Ed recently to where you have a "GUESS" if Ed is going to have enough radios to fill orders before February 10th the Chinese New Year? I know Ed asked for 100 additional before their Holiday shut down, but he will probably get less.
I ordered mine the middle of December and I think he is shipping the end of November.
Again if anyone receives a radio in the future, if they would post their order date, it gives us a guesstimate.

The price here in the UK for the first AT-588UV's to hit these shores via a UK dealer seems to be £249.00. That is £20 dearer than the Wouxun! That does take some believing, are we being taken for a ride again?

Might be cheaper to import direct??

Thank you Milton for pointing that out. I did not making any comment about using the Anytone to program my Blackbox. Nothing in my comment even brought that up. All I mentioned was the simularites of the software and that was all. You really reached deep for that response.

Clicked modify and driver would not load, said ini file would not load. I rebooted, this time clicked remove, then rebooted, then clicked modify again; it took a little longer this time and then said it loaded sucessfully. It said to reboot and I did, and after reboot I plugged in the cable and ran the software. No problems. Read the radio fine. I put 3 screen shots of the software in the photo sections. I will start programming now. I would like to make a screen shot of the software pages with some explanations of the functions and options and what they mean as we

figure them out, especially the ones that are not clear in the manual.

I just assumed that when you said "that is the exact format and layout for my rig" that you might be inclined to try the Anytone software. No biggie.

Thank you Milton for pointing that out. I did not making any comment about using the Anytone to program my Blackbox. Nothing in my comment even brought that up. All I mentioned was the simularites of the software and that was all. You really reached deep for that response.

You use the QSP588UV software. you can download it
in one file from importcommunications.com. Scroll down
past the radio picture and you'll see a link to download from.
When I put the software in this group, Yahoo has a single
file size limit that this software exceeded. So it was necessary
to chop it up in an archive that will extract the single file
from all three parts. Windows 7 can handle zip files natively.
Windows XP you would need Winzip instlalled. But if you
grab the whole file from Import Communications it's a self
extracting installer. Be sure to follow the instructions about
installing the USB cable driver exactly.

Milt,,

Yes, availability with regard to the Chinese new year dead line has become a major concern to me also. I have some decisions to make.

The radio is crucial to an important aviation event I have coming up, later in February,

If I know it is not going to be available, I will try to purchase a substitute at the Feb. 8th Hamcation in Orlando.

Ed said that he planned to attend the Hamcation, but if he is out of stock, he will have nothing to sell. Hope he keeps a display unit so I can, at least, see what it looks like up close.

I plan on being there when they open on Friday Noon and hope I can find and talk to Ed.

Even if I have to buy a substitute at the Hamcation to cover my special aviation event, I still want to purchase a anytone unit from Ed.

I hesitate to call him, It takes his precious time and delays everybody's orders.

The Chinese new year operation sets a month delay (at least) on any future orders..

Well I tried this out this weekend. Took the bracket off the radio chassis and put the head on it. Now it’s too front heavy to sit in the cell phone holder

There would also be challenges with connecting the extender cable.

I'm thinking John means that the mount on the

radio body can be removed from the radio body.

Looks like it is just a plastic shell probably

very similar to what Anytone is now offering.

And the radio would function normally without

this plastic docking bracket that is attached to the

radio body. Does that make sense ? LOL!

John

Not entirely sure what you mean by “You should take a look at the mount on the radio- easy to remove and it fits the head perfectly.”

I’m currently using a phone holder turned horizontally but the pieces that extend to the rear of the head for placing in the radio body make it difficult to get the proper grip.

Cris

There is a mount coming but don't have time frame. I mounted mine to a beanbag type GPS dash mount using a piece of aluminum and velcro to stick the head to the aluminum. You should take a look at the mount on the radio- easy to remove and it fits the head perfectly.

Anyone done this?

I work in IT and actually write Windows 8 cert questions for the Microsoft exam :)

Neither the driver that comes with the Anytone software or the driver with the Wouxun radio seem to work with Windows 8

Works fine on my xp laptop (corporate machine)

But my personal laptop and desktop are both Windows 8 and no go for me

Anyone made this work?

1021. Volume Control Range- FYI

Yahoo group: Anytone_AT-588UV
Date: 2013-02-03 14:19:32 UTC
From: jwheatleyus
Topic: 1021 Message: 1021

I just noticed that the bottom 15 degrees or so of the volume controls is Zero audio. As you reduce the volume setting, there is a point where the audio output suddenly drops out but the control still has about 15 degrees of turning range. I can hear very light 'ticks' as I turn the control, so I suspect it is a rotary encoder rather than a pot.

While in the standby mode, rotate the selector
for the Main side to the channel you want to skip. Press and hold
SCN for approx 1 second until the word SKIP appears above the
channel name or frequency. For a channel already being skipped
do the same as about this time rotating the Main side selector knob
to the channel having the word SKIP appearing above. Press SCN
this time momentarily. the word SKIP should disappear. If your radio
does not follow these simple instructions it may then be an issue with
the radio. At that time do a factory reset by holding the right side SCN
button in and then powering the radio on. You'll lose any settings so
have a backup of your latest settings and channels prior so you can
load everything back into the radio. let me know how things work out
for you.

Subject: [Anytone_AT-588UV] Channel scan skip puzzle.

I searched this list's emails for the above topic without result.

I have followed the instructions on page 14 as to "Channel Scan Skip" without success. How do I mark a memory channel as to "skip" and how do I remove the "skip" notation?

I have one memory channel marked "skip" which I don't remember marking as such and I would like unmark it.

Additionally, there are a couple of memory channels I'd like to take off the scan by marking them as skip.

As to the instructions on page 14, no matter how long I press the SCN button I get into the "Channel Delete" option (page 15) with the memory channel number flashing. Never do I hear anything that I can interpret as the sound of "DU DU". Further, the word "skip" never appears on the display.

Also, as a previous poster noted, I have no idea what either "DU" or "DU DU" refers to. It must be a beep of some kind.

So, how do we mark and unmark a memory channel to be skipped without getting into deeper "DU DU" confusion?

I've heard the same thing. Hard to imagine using a rotary encoder though.
I expect the demodulated and filtered audio heads off to a volume control
IC before it goes through the switching network where the path to internal
or external and speaker mic is selectable by a firmware setting in the set menu
item. So when you consider the final end of the audio path being controlled
by the radio's micro, it's not hard to understand where turning a potentiometer
and that controlling amplification by an intermediate IC, that some of the digital
control artifacts may enter the audio stream. So in a sense of the value of the
potentiometer isn't really in the audio path itself, I guess you could consider
it an encoder.

You first need to verify if msflxgrd.ocx is on your computer. Since you didn't mention which version of Windows you have, there are 2 places to look,
For 32bit version: C:\Windows\System32\msflxgrd.ocx
For 64bit version: C:\Windows\SysWOW64\msflxgrd.ocx

If it is not present on you computer try uninstalling and reinstall QPS588UV_1.00. msflxgrd.ocx is an ActiveX control that should be installed and registered automatically when installing QPS588UV.

If it is present, it didn't register properly. Registering it is pretty straightforward:

for XP click Start then Run type "cmd" in the box click "OK", in the DOS window copy and paste without the quotes "regsvr32 C:\Windows\System32\MSFLXGRD.ocx" then hit Enter.

for Win7 32bit: click Start > All Progams > Accessories right click on "Command Prompt" click "Run as Administrator" in the DOS window paste "regsvr32 C:\Windows\System32\MSFLXGRD.ocx"

for Win7 64bit: same as 32bit except paste "regsvr32 C:\Windows\SysWOW64\MSFLXGRD.ocx" in the DOS window

Hope that helps.

I've had software installed the the install script was flubbed up and I've had to manually register dlls or other things. Sometimes happens when the system doesn't meet minimum requirements for the software or the operating system itself.

Make sure you run the command prompt as administrator.

I simply used the back slide off detachable plate of the front head unit, as my mounting plate. Worked great.

From: sammysnod123
Topic: 1033 Message: 1033

Found an interesting feature of the ver 1.0 programming software. If you try to enter the channel name into the boxes using the "more section", in caps it does enter them, however after the entry it gives you a shift tab function and moves the cursor back one complete entry. If you enter the name in lower case it functions normally. The display only shows caps even though you enter upper or lower case.

The programming cable is an USB to 8pin telephone type cable that plugs into the Mic jack on the head.
The RF Coax connector is a standard UHF female on the radio, so the antenna cable connector is a UHF Male.

I do not have a radio But .....

From what I can discern from the manual and photos. The programing is done via the microphone input jack and this jack is a standard Cat 5 (maybe Cat 6) connector.

The antenna connector is standard to most all american radios, and all licensed amateur radio operators should recognize it.

Looks like my radio may delayed due to the chinese new year..

I'd call that more of a bug. It's like entering letters to control the screen when the radio powers up. If you enter a alpha-numeric character then tab to the next cell to the right, the first tab works. Then the second doesn't The third I think actually moves the cursor back to the beginning. But if you click on each cell, you can enter a character. And that just changes the left display of Anytone to what every you want. I haven't been able to find a way to change the right side yet. On my Wouxun UV6D you can change both sides with software but not via the radio. You can't even change one side via the radio. But at least for now you can program channels and backup and restore your radio.

It will work in Windows 7 but it is buggy. You have to read
from the radio, make the modifications to that file. Then save
that file. Then close that file and reopen it and write it to
the radio or it will usually crash. Sometimes just saving the
file with a few file name (I usually use the date) will keep it from
crashing. I also right click and chose the compatibility mode
for Windows XP and run as administrator. So if you can remember
these things if you run into a "string error" popup and when you
close that, the program disappears from the screen, these steps
will help prevent that. I suppose the application would run fine
in XP. I tried it in Vista Pro and it crashed a lot less but I got
into the habit of saving the file then writing it, who wants to lose
a bunch of changes. And if you want to save multiple edits in
one day you can name them 02-04-13-a.dat 02-04-13-b.dat
and so on.

That's nearly the same way I had my Icom 706 mounted. I built
a stand to bolt into the console of my Tahoe and then bolt to the
head bracket. Almost in identical location as yours. Didn't have
the GRE scanner but I have one now. However no room for the
stock radio and CD player. I guess that's why you replaced it
also with a Kenwood. Did you loose your door open pinging
sounds to alert you if you left keys in the ignition or didn't
shut the lights off? That was my one drawback about a OEM
replacement stereo and mounting the 706 under it in the dash.

From: w6bre
Topic: 1047 Message: 1047

I understand that the new 5888 is Part 90 approved. My question is will it allow you to TX in the wide mode on 154.5525 freq? Does it look like it defaults to narrow band in the commercial frequency range?

Also is the radio locked and software is needed to unlock the radio per the FCC regulations?

I won't comment on "FCC Regulations" but my AnyTone has a FCC ID Sticker that indicates it is legal for Part 90 operation and I use it regularly for Part 90 as well as Amateur frequencies. Just like my fleet of Motorola and Kenwood HTs and Mobiles, each channel must be programmed as Narrow or 12.5KHz for Part 90 Channels. It is possible to improperly program the AnyTone, Motorola, or Kenwood radios as Wideband. It is up to the user to ensure that the radio is programmed Narrow for Part 90 channels. None of my radios 'Default' to Narrow in the Commercial frequency range- all must be properly programmed. The AnyTone is not 'Locked'- it can be changed via the front panel controls.

I chose to go “cheap” with the lesser GM interface and so yes I lost the “chime”

You can spend more and get the interface that gives you the keys/door open/turn signal still on/ still working

Just an FYI

Mike at Mike's Electronics in FL has the radios in stock. I stopped by his store last week to check out the radio. He didn't give me the exact #, but he says he does have several in stock.

This is his contact info from his website (www.mikeselectronicsfl.com)

1069 NW 53 STREET, FT. LAUDERDALE, FL. 33309
PH: 954-491-7110 FX:954-491-7011
TOLL FREE 800-427-3066 mspivak@...

I have no affiliation other than a loyal and satisfied customer of Mike's for many years. I just wanted to share the info with you all since it seems Ed might be overwhelmed with orders lately causing a bit of a supply chain bottle-neck effect.

However, you should note that GMRS is part 95 NOT part 90

FCC mandated in 2013 transmission in business
and public service bands have a channel spacing
of no more than 12.5 khz. This radio is equipped
for channel spacing of 25/20/12.5 khz. If you hold
the proper license for those bands it will be legal
for you to use the radio on whatever frequency
outside the amateur band your license covers provided
the radio is set to 12.5 khz. You could even use it
inside the ham band at 12.5 khz but it's not mandated
by the FCC and might have undesirable affects with
repeater or simplex operation.

I understand that the new 5888 is Part 90 approved. My question is will it allow you to TX in the wide mode on 154.5525 freq? Does it look like it defaults to narrow band in the commercial frequency range?

Also is the radio locked and software is needed to unlock the radio per the FCC regulations?

I have the standard 2003 radio in my Tahoe. It's a fairly good sized unit with both CD and cassette. But all the warning chimes go through its amplifier. I had a mobile audio place tap an output to turn on and off my subwoofer and give it some audio from the radio. I was going to go originally with a decent Pioneer 50 x 4 watts, in dash DVD and about the same size as the GM unit but I would have lost the warning rings. After replacing the 4 factory speakers I found the GM was actually pretty decent sounding along with a 300 watt 12" sub in the very back. And I don't like it so loud that the body outside buzzes. Plus I had at the time an 8" stand alone DVD player that those seated in the rear could watch.

I chose to go “cheap” with the lesser GM interface and so yes I lost the “chime”
You can spend more and get the interface that gives you the keys/door open/turn signal still on/ still working

That's nearly the same way I had my Icom 706 mounted. I built a stand to bolt into the console of my Tahoe and then bolt to the head bracket. Almost in identical location as yours. Didn't have the GRE scanner but I have one now. However no room for the stock radio and CD player. I guess that's why you replaced it also with a Kenwood. Did you loose your door open pinging sounds to alert you if you left keys in the ignition or didn't shut the lights off? That was my one drawback about a OEM replacement stereo and mounting the 706 under it in the dash.

I've added a photo to the group photo section here
http://groups.yahoo.com/group/Anytone_AT-588UV/photos/album/1361681581/pic/list

This is my 2011 Chevy Impala. This is not intended to be permanent...waiting to see what Anytone comes up with.

This is a Bracketron Universal Cell phone on a gooseneck suction cup mount. Used a adhesive disk on the plastic console for the suction cup.
Pulled off the side "holders" and turned it around. Using the Radio Shack "super lock" strips to secure it to the base. Yes that is GRE PSR-600 mounted in the dash under the Kenwood stereo.

Any and all feedback is welcome

From: evh1001
Topic: 1059 Message: 1059

I've taken an initial stab at interpreting the file formats used in the QPS588UV_1.00 programming software. I haven't looked at the *.dat file, but the format of the *.fre is shown below. There's still a few unknown fields, and I'm sure there will be errors. But it's a starting point. I'll also upload a file called AT588UV_Exporter_1.0.0.zip that will export the basic fields to a CSV file so it can be loaded into Excel, Open Office, etc. and printed out.

```
typedef struct {
WORD recordNumber; //1=first record, 2=second record, etc
WORD unknown1;
WORD scanSkip; //0=Off,1=Skip,2=P Scan
CHAR receiveFreq[9];
CHAR transmitOffsetFreq[9]; // 000000000 if same frequency, 001000000 if 10Mhz above OR
below -- see ,
CHAR name[7];
WORD step; //0=2.5KHz .. 9=50KHz
WORD transmitOff; //0=No, transmit is not off,1=Yes, transmit is off
WORD reverse; // 0=not reversed,1=reversed
WORD channelSpacing; //0=25KHz, 1=20KHz, 2=12.5KHz
WORD reverse_DCS_Encode; //0=false,1=true
WORD reverse_DCS_Decode; //0=false,1=true
WORD unknown2;
WORD unknown3;
WORD offsetDirection; //0=TX and TX are the same freq,1=TX freq is below RX freq,2=TX freq
is above RX freq
WORD transmitPower; // 0=High,1=Middle1,2=Middle2,3=Low
WORD mode; //0=FM,1=AM
WORD unknown4;
WORD compander; //0=Off,1=On
WORD talkAround; //0=disabled,1=enabled
WORD CTCSS_DCS_Encode; // 0=Off,1=CTCSS,2=DCS,51=Define
WORD CTCSS_DCS_Decode; // 0=Off,1=CTCSS,2=DCS,51=Define
WORD dtmfSignalling; //0=M1,1=M2,15=M16
WORD CTCSS_Encode_Tone;
WORD CTCSS_Decode_Tone;
/*
0=62.5
1=67.0
2=69.3
...
50=254.1
51=Define
*/
WORD DCS_Encode_Tone;
WORD DCS_Decode_Tone;
```

```
/*
0=D000N
0=D000l
1=D001N
1=D001l
511=D001l
*/
WORD busyChannelLockout; //0=Off,1=Repeater,2=Busy
WORD PTTid; //0=Off,1=Begin,2=End,3=Begin and End
WORD squelchMode; //0=Carrier,1=CTCSS/DCS,2=OptionalSignalling,3=CTCSS/DCS AND

Based on the nice work by evh1001 (i don't have a name or call for proper credit), I started a web utility:
http://dwestbrook.net/projects/ham/anytone/qps588uv.cgi
That will display a .FRE file in a HTML table.

it's just quick-n-dirty so far ... I'll add a .csv (of both the raw and the print-friendly values) export soon, and possibly a nice printable PDF.
Will post source code (perl) as well.

Anything that shows up in red means I still need a definition for ... I know that these are missing/incomplete:
step
CTCSS_Encode_Tone
CTCSS_Decode_Tone
DCS_Encode_Tone
DCS_Decode_Tone
Anyone have the full list of values for each handy for me to paste in?
Otherwise I think i've got everything that evh1001 listed ...

thanks,

Nothing you can do besides a factory reset
with the mic unplugged. Hold SET while powering
the radio on, insert mic and see what happens.
If the radio shuts off, contact the dealer and explain
what the problem was and what was done prior to
the problem. You'll probably get an RMA and
ship the radio back for the dealer to decide what to
do to it. There is a slight possibility the attempted
read by the computer corrupted the working memory
and a factory reset might cure that. I think you will
find in the manual it says don't turn the radio off and
on with the USB cable plugged in. Now if this is an
indication that you can corrupt the memory I don't
know. I know the firmware can't be touched by the
programming cable. Let us know what you find after
resetting the radio.

If you are after a radio that you need basic funtionality
and aren't interested in a lot of bells and whistles, the
AT5888UV is a great choice. As in any extremely complex
electronic device it has its set of growing pains. And trust me
I know of every one so far. But I own two radios and any
glitch or quirk I've been able to find a way to work around
them. I also own a Yaesu FT8900R quad band mobile.
Similar in setup to the AT5888UV, it also has some glitches.
And I paid twice the money for the Yaesu because it is a
famous brand name. It's my feeling you will never get away
discovering oddities of these multi-band dual receive radios.
Problems are inherent in the design but minimized of a period
of time. I think the AT588UV is very much well worth the money.
I think the price as actually dropped. And the factory is paying
close attention to the feedback from dealers and advanced customers
like myself. They know I have very advanced communications
diagnostic equipment at my disposal and I've sent videos to them
illustrating different hiccups the radios have. I can't say there are
any better Chinese radios out there. But I can say there are worse.
But as a whole the Chinese do know their stuff. The shop I have
access to their test gear sells a Chinese radio that does digital APCO-25
and another that does the TDMA 6.25 khz protocol from Motorola,
forget what it's called. They also do DMR well. HYT / Hytera is the brand.

Anyway to get back on track, the Hyteras sell well here. All the guys
at the shop like them. And since the owner of the shop has been a friend
going on 25 years I'd take his advice in Chinese made gear. I showed
him the AT5888UV when I was running it through an analyzer. He
seemed to be impressed about everything except the mic jack being
on the side. So it's not really about luck unless you were unlucky to
receive a radio that slipped by QC with a problem which is what a
warranty is for. Just my two cents...

Greetings all,
I agree with Milt, not having the test equipment but still with 32 years of hamming I can say the Anytone does a tough job well. Multi-band VHF-UHF equipment has it's quirks no matter what the brand. But if you are looking for a radio that had a hot receive and transmit, this one is hard to beat. If you expect a "perfect" radio, well as in life there is no such animal, either single or dual band. It does not matter if you pay $50.00 or $5,000.00 for it.
If you look at the reviews of ANY radio you will see quirks. Just google any radio and add the word "problems" you may be surprised. Yes, even the $10,000.00 + radios. Nothing is perfect.
I guess the short of it is that I like the radio:) I can hear and hit repeaters that are truly on the fringe (100+ miles out) and one thing I really like is I can hear a few that I can't hit. That goes to the old adage "you can't work em if you can't hear em" which is why I design and build my own antennas, hihi.
There are so many variables in VHF/UHF work antenna, coax, height, things in the way, gain, loss, take off angle, and conditions. You can take identical radios, coax, antenna, and mount the antennas side by side and you will often get a different response. Then move the antenna 10 feet in any direction, up, down, left right, and still get different results.
All of the above adds to the wonder or frustration (depends on how you see it) of ham radio. The idea is to make sure YOU are happy with the results (within reason, of course).
If one has a J-Pole at 30 feet and his friend has a 15 element beam on a 100 ft tower the results will probably be different, hihi. But if that same ham has a Moxon or 2-3 element beam and lives on a slight rise, well the difference will or can be much less.
Some may say this is far off topic...but it's not. The gist is that all radios have "quirks" and the radio in and of itself is not a system. Add all of the rest antenna, gain, height, terrain, coax and you have a better idea of a radio system.
Now add to this people like Milt and Ed and those who are in the group here trying to improve and share all of the info for the good of the users of the radio and that is a fine situation:) This makes it a win-win situation. This is my humble opinion.

If you are after a radio that you need basic funtionalityand aren't interested in a lot of bells and whistles, theAT5888UV is a great choice. As in any extremely complexelectronic device it has its set of growing pains. And trust meI know of every one so far. But I own two radios and anyglitch or quirk I've been able to find a way to work aroundthem. I also own a Yaesu FT8900R quad band mobile. Similar in setup to the AT5888UV, it also has some glitches. And I paid twice the money for the Yaesu because it is a famous brand name. It's my feeling you will never get awaydiscovering oddities of these multi-band dual receive radios.Problems are inherent in the design but minimized of a periodof time. I think the AT588UV is very much well worth the money.I think the price as actually dropped. And the

factory is paying close attention to the feedback from dealers and advanced customerslike myself. They know I have very advanced
communications diagnostic equipment at my disposal and I've sent videos to themillustrating different hiccups the radios have. I can't say there areany better Chinese radios out there. But I can say there are worse.But as a whole the Chinese do know their stuff. The shop I have access to their test gear sells a Chinese radio that does digital APCO-25and another that does the
TDMA 6.25 khz protocol from Motorola,forget what it's called. They also do DMR well. HYT / Hytera is the brand.
Anyway to get back on track, the Hyteras sell well here. All the guysat the shop like them. And since the owner of the shop has been a friendgoing on 25 years I'd take his advice in Chinese made gear. I showedhim the AT5888UV when I was running it through an analyzer.
He seemed to be impressed about everything except the mic jack beingon the side. So it's not really about luck unless you were unlucky toreceive a radio that slipped by QC with a problem which is what a warranty is for. Just my two cents...

1076. Problems in a Hybrid vehicle

Yahoo group: Anytone_AT-588UV
Date: 2013-02-07 14:23:36 UTC
From: jarsmember
Topic: 1076 Message: 1076

I have my Anytone radio mounted in a Ford Escape Hybrid, wired direct to the battery. I have noticed that when I have either side of the radio on UHF that my mileage drops noticeably. When I take it off of UHF and have both sides on VHF the mileage returns to 28.7 MPH. Also, when I have either side on UHF and turn the volume up, I get a horrendous whine coming from the radio. I was wondering if anybody has had similar problems and how they corrected it, especially the MPG issue caused by UHF.

The whine sounds like maybe alternator type noise. Is the mileage drop during Tx and is it only the indicator reading wrong? Where is the antenna located?

The mileage drops during receive and the antenna is located at the rear of the vehicle above the lift gate. I had another brand of dualband radio in there before this one and had no problems.

Maybe try a filter on the DC input line (big fat Capacitor) in case the noise is coming out the power line. Are you using the long remote head cable? Antenna leakage is probably not the problem source as it is far away.
You might have to go back to the radio that worked. Some problems are not worth fighting.

1080. US Narrow Band Frequency Question

Yahoo group: Anytone_AT-588UV
Date: 2013-02-07 15:51:28 UTC
From: Sball97009
Topic: 1080 Message: 1080

I am programming my 5888UV with the software ver 1.0 and when I put in some narrow band frequencies the software roles the frequency back to another frequency. Ex. 155.79750 Mhz will default to 155.79500 Mhz.

My questions are,

Is there a newer version of the software that recognizes the narrow band frequencies?

I have not tried to direct impute these frequencies into the radio yet by using the mic keypad so,

Will the radio accept these frequencies by programming them directly into the radio?

Any help would is greatly appreciated.

I'll give it a try soon using the QSP5888UV 1.0 software
but something tells me that this might be a channel step issue
especially if others can program that frequency while you can't.
You might try a smaller channel step than you currently have set.

You might try some toroid chokes to decouple
the radio from the dc source right where you
have your power cable attached. One toroid
there, one at the cable plug, one toroid at each
end of the remote cable. You can search Google
for instructions of what size toroids you need
and how many wraps around them. I've heard
people using them to isolate this and that but never
did write down or make not of the exact specifications.
One recent case was an Alinco DX-SR8T 100 watt
all mode HF transceiver that had a detachable head.
I happen to own one of those by the way, nice rig.
One gentleman was getting feedback on SSB through
the microphone causing a squeal. He put toroids on
both ends of the remote mount cable solved the squeal.
I don't recall what the specifications were and they may
be irrelevant to your unique situation. I've got a couple
friends who own an operate a commercial radio sales
and service facility so I may ask them if they have ever
run into this situation.

Milt.

Well jeeez! Wonder what the hell could be different?
Guess I'll try it later and change the step and see if I can
recreate your situation.

I'll give it a try soon using the QSP5888UV 1.0 software
but something tells me that this might be a channel step issue
especially if others can program that frequency while you can't.
You might try a smaller channel step than you currently have set.

Subject: [Anytone_AT-588UV] US Narrow Band Frequency Question

I am programming my 5888UV with the software ver 1.0 and when I put in some narrow band frequencies the software roles the frequency back to another frequency. Ex. 155.79750 Mhz will default to 155.79500 Mhz.

My questions are,

Is there a newer version of the software that recognizes the narrow band frequencies?

I have not tried to direct impute these frequencies into the radio yet by using the mic keypad so,

Will the radio accept these frequencies by programming them directly into the radio?

Any help would is greatly appreciated.
Scott

I want you to answer this question. Do you have a
computer readout of your milage and that's what
you are looking at to see the milage drop?

If so the radio could be merely interfering with the
readout alone and not actually the fuel consumption.

I'd have a better time believing that than a real drop
in the milage per tank of fuel. Especially if you don't
notice a change in the way the vehicle runs like a drop
in performance, change in idle etc...

I've sent some email off to my friend, an extra class ham
who holds a commercial radio license and operates 3 repeaters
at his home. He also works for a commercial radio reseller
and service company as a consultant. I asked him if he's ever
encounter a situation like this and what he might do to isolate
the radio from the electrical system.

I already have a filter in line. I am using the long remote head cable that came with the radio.

Everything is the same as the radio I took out and put this one in its place.

Before I switched to this radio, I was getting 28.7 mpg per computer readout with the other radio on VHF & UHF. After installing the Anytone, per the computer readout, the mpg is 25.8 mpg.

Does the problem change if you use the short head cable?- ie move the head to the radio. If so, maybe wrap the remote cable a few turns through a toroid.

Not that I don't believe you I find it hard
to believe that the UHF receiver could generate
enough of whatever it's generating to increase
your fuel consumption without affecting the
performance of your vehicle or without causing
the computer to alert you somehow. I know the
hybrids have a pretty complete information center
so I would assume there would be some other indication
of a problem caused by the radio. Anyway, toroid yourself
up, on everything except the mic. You might get lucky.

I programmed the radio in the house and tried it there hooked to an outside antenna and still had the noise issue on UHF. In the vehicle, there is no other way to mount the radio than remote mount. I have tried locating the body of the radio in different locations with the same results.

Subject: [Anytone_AT-588UV] US Narrow Band Frequency Question

I am programming my 5888UV with the software ver 1.0 and when I put in some narrow band frequencies the software roles the frequency back to another frequency. Ex. 155.79750 Mhz will default to 155.79500 Mhz.

My questions are,

Is there a newer version of the software that recognizes the narrow band frequencies?

I have not tried to direct impute these frequencies into the radio yet by using the mic keypad so,

Will the radio accept these frequencies by programming them directly into the radio?

Any help would is greatly appreciated.
Scott

I maintain the OP is not allowing a 2.5khz channel step.
Subtract 7950 from 7975 what do you get? a 2.5 khz step.
If the software is set to anything besides a 2.5khz step how is
it going to come up with 7975? So like I mentioned use the
last cell on the main frequency list where you want to enter the
frequency. When you float your cursor over it you should
get a popup bubble saying More. Double click on that cell
and enter the frequency there along with a 2.5khz step.
This is not rocket science.

I opened the software, read the radio, went to the MORE cell
and double clicked on it. In there I was able to type in
155.7975 for both TX and RX. When I closed the box
it then appeared in the main channels box. Channel step
was 2.5 khz. I wrote the file to the radio and 155.7975
appeared behind my previous last main channel. So if
you are not doing it this way give it a try. If you are then
I'm baffled and that doesn't happen regularly :=)

I'll give it a try soon using the QSP5888UV 1.0 software
but something tells me that this might be a channel step issue
especially if others can program that frequency while you can't.
You might try a smaller channel step than you currently have set.

My software allows entry of 155.7975 in the Normal Channel Edit, either Rx or Tx completely independently of the Step as it should. Step size is not used whenever you directly enter frequencies in the software- Step is used by the radio for Tuning click steps and for scanning steps.
I think you may have the wrong software version- sounds like you have software intended for a 5K Step radio. Suggest you uninstall and download the latest from

Another thought- where did you purchase your radio? I see 588UVs on the internet with 5K Step- NOT 2.5K. If that is what you have, that is the answer. The software will know that 2.5K frequency increment is not available.

The AT_588UV software will not work with the newer
firmware equipped radios shipped as of January. If you
have the QSP5888UV software installed and it communicates
with the radio, my instructions I have posted several times
will work to garner the 2.5khz step. Otherwise there is a problem
with the computer or the radio.

Odd...well that's what I would suggest you do.
Program the channel in manually, it's not hard
and then save it to memory. Once it's in memory
then read the radio with the software and see
how that channel shows up in the list.

OK, when all else fails, start over. Deleted and uninstalled all past files and reloaded the programming software from the website I was directed to.
Everything seems to be working now. Not sure what was happening before but I am happy now.
Thanks for every ones help.

Scott

Glad you got it worked out. If you could enter the freq
in VFO then it had to be the software. And I've seen some
real weird software issues having been around a computer
for 20 years or so.

OK, when all else fails, start over. Deleted and uninstalled all past files and reloaded
the programming software from the website I was directed to.
Everything seems to be working now. Not sure what was happening before but I am happy now.
Thanks for every ones help.

Another thought- where did you purchase your radio? I see 588UVs on the internet with 5K
Step- NOT 2.5K. If that is what you have, that is the answer. The software will know that
2.5K frequency increment is not available.

From: wa4vrv
Topic: 1112 Message: 1112

Well, my rig arrived today and I "read" the radio prior to uploading to the radio. When I first turned on the radio, the LCD Backlight was "RED" (more like amber). When I did upload to the radio, the LCD Backlight went to "BLUE" and nothing I do following the manual disconnected from the programming cable, will change the LCD Backlight to any other color.

HELP!

OK - Update - I reprogrammed the radio to the original settings and read the Function Setup and it had the "RED" with a value of 32 and the other 2 colors were single digits. So, I changed the values in my program and now I have a "RED" display.

Oh well!

Re. Radio affects mileage on Ford Hybrid'

I don't know if you solved your problem But...

At the Orlando amateur radio Hamcation today, I brought up the issue about the radio in the Ford Hybrid affecting the miles per gallon indication.

One person (I think was affiliated with a dealership) raised a thought.

The Calculated efficiency of the system may be a computed by the sum total energy generated and the sum total energy consumed.

These values may be obtained by measuring and summing all the individual currents to and from each device and comparing it with the actual current to and form the battery, Thus providing a figure of merit of the mileage performance of the system,

With the radio connected directly to the battery terminals, Its current load would not be included in the calculations and affect the MPG vaues. What happens if the radio is operated from another battery source.

Kinda far out but also may be a clue.

I like the blue display with a touch of green. Red is set to 0, blue to 32 and green to 10. The red would be ok at night I guess but so is blue. It would be really cool if the Anytone designer would have added a function that you could change the colors by hitting a function button then turning either channel encoder. I've seen some CB radios, one particular from Cobra that had about 5 different colors you could select from just by hitting a set button and turning the tuning knob.

Insufficient current or voltage from the radio's power supply?

I've used a conventional 10 amp supply from Radio Shack
on my FT8900 and the AT5888UV and that was sufficient.
I think the supply is underrated, I only got a 1/2 volt drop on
transmit. The supply is beefy and has a pair of 2N3055 pass
filters on the heatsink in back. My other supply is a Diamond
SMPS and does 30 amps continuous.

Glad you got it figgered out!

When receiving only, which is almost all of the time (comparatively), why would receiving on either the VHF or the UHF bands consume any more electrical current than the AM/FM broadcast band radio does (likely some amount, too-small-to-measure through MPG differences)? The digital switching involved in scanning should only consume some low number of mili-amps (even more un-measurable through MPG). Does listening to AM/FM broadcast band radio affect the mileage on your vehicle? On an all-electric vehicle, I could see that transmitting a lot might affect the overall range between charges (some small amount). But I can't imagine it even being measurable through MPG on any vehicle with an internal combustion engine (thus miles per gallon of gasoline).

1127. RE: [Anytone_AT-588UV] Problems in a Hybrid vehicle

Yahoo group: Anytone_AT-588UV
Date: 2013-02-10 10:36:47 UTC
From: Steven Rundquist
Topic: 1076 Message: 1127

I wonder if there might be a local oscillator in the UHF receive circuit that affects the vehicle's computer control over the engine. All digital chips like the ones that control how the engine runs, require a clock oscillator source to process their digital functions. If that oscillator for your engine's controls are from a crystal or a resonator (as opposed to being driven by a powered oscillator source), that chips ability to process internal instructions that keep your engine optimized from one moment to the next, could be more easily compromised by RF, perhaps even from a radio receive circuit. Maybe the "horrendous whine" you're hearing is coming from that engine control chip's clock oscillator source on the same frequency or some harmonically related frequency as your radio's local oscillator, directly in to your radio's local oscillator. That might be kind of a stretch, but the only one that I can think of, unless there is a direct short somewhere in the power supply line to your radio. There shouldn't be enough current draw from the radio (especially when receiving) to noticeably affect mileage. If it's not too expensive, I would plug the engine in to a diagnostic machine and see if turning on the radio and selecting UHF, changes how efficiently the engine runs. I don't know if these machines at the average local mechanic's shop would be good enough, or if you would need to pay a few hundred dollars at the dealership for this.

Subject: [Anytone_AT-588UV] Problems in a Hybrid vehicle

I have my Anytone radio mounted in a Ford Escape Hybrid, wired direct to the battery. I have noticed that when I have either side of the radio on UHF that my mileage drops noticeably. When I take it off of UHF and have both sides on VHF the mileage returns to 28.7 MPH. Also, when I have either side on UHF and turn the volume up, I get a horrendous whine coming from the radio. I was wondering if anybody has had similar problems and how they corrected it, especially the MPG issue caused by UHF.

These are good points to consider. But I'm not so sure that a drop in the engine's fuel-use efficiency would necessarily be accompanied by any perceptible change in performance that could be noticed by anyone in the vehicle.

I want you to answer this question. Do you have a

computer readout of your milage and that's what

you are looking at to see the milage drop?

If so the radio could be merely interfering with the

readout alone and not actually the fuel consumption.

I'd have a better time believing that than a real drop

in the milage per tank of fuel. Especially if you don't

notice a change in the way the vehicle runs like a drop

in performance, change in idle etc...

I've sent some email off to my friend, an extra class ham

who holds a commercial radio license and operates 3 repeaters

at his home. He also works for a commercial radio reseller

and service company as a consultant. I asked him if he's ever

encounter a situation like this and what he might do to isolate

the radio from the electrical system.

Have you measured the current in amps, through the dedicated power line in to the radio? If there's a short in the radio, maybe it's drawing a consistent high power draw all the time, keeping your alternator working overtime.

Topic: 1125 Message: 1130

I certainly had made a comment regarding that, but really believe the issue is the result of intermod. I drive through downtown St. Louis going to work every day. A VERY RF rich environment with most of the TV stations having their transmitter's downtown as well, several fed agencies, etc.

I had a similar issue with my GRE 600 scanner mounted in the car and found that if I turned on Attenuation on the scanner when traveling through the area, I can hear pretty well

So at the suggestions of some in the group, I removed my gain attennae and set the RF SQ to either 9 or FULL when travelling through downtown.

As a further test, yesterday I received a MFJ 916B Duplexer. I know have 1 UHF antenna and 1 VFH antenna connected to it (cut to the range I'll be working in.mostly public safety) Won't go to St Louis again until Tues, but I'll be interested to see if this makes any difference instead of a single dual band antenna.

I have two radios, the newer built in early January 2013 will let
any signal through on the sub band. The older will not, just those
matching the decoding tone if set. So I assume this is what you mean
not that it won't decode, rather it allows any signal to open squelch. So for
some radios it is possible a firmware issue. Not sure, we sent some
video and testimony back to China for Anytone to analyze. I haven't
heard the results yet.

With a really hot receiver able to pull out a -127 dBm signal, it's going to be more prone to intermod. Especially if the bandpass filter in the first IF is too wide allowing unwanted signals into the following amplifier and mixer stages. My radio meets the greater than -70dBm adjacent channel rejection so I know it's not a design flaw. Anytone may be using some cheap bandpass filters that have little quality control and allow unwanted signals into the passband rather than having a lower shelf and narrow passband. Again it's speculation as I have no technical errata on the unit itself, just many years of experience with radio gear in general.

I'm not sure either. Obviously if you are to trust
the owner, then you are looking at a signal generated
within the radio as in a VCO, PLL oscillator, clock generated
signal traveling the DC cable back into the engine's computer.
Now that actually isn't too unusual. I wouldn't expect it
to be infiltrating through the aid as I imagine the vehicle
computer is well shielded. I've asked the owner to do a little
research on adding some toroid filteres to the DC cable at
both ends to decouple the DC input. I don't know how many
winds or what size he would need. I think the owner also
uses the remote mount cable. I advised to toroid that also.
Toroid cores are cheap so if it didn't work, there wouldn't
be much of a loss. Until the owner experiments a bit not
much anyone can do besides sit and wait and speculate.

Subject: RE: [Anytone_AT-588UV] Re: Problems in a Hybrid vehicle

When receiving only, which is almost all
of the time (comparatively), why would receiving on either the VHF or the UHF bands
consume any more electrical current than the AM/FM broadcast band radio does (likely
some amount, too-small-to-measure through MPG differences)? The digital
switching involved in scanning should only consume some low number of mili-amps
(even more un-measurable through MPG). Does listening to AM/FM broadcast band
radio affect the mileage on your vehicle? On an all-electric vehicle, I could see
that transmitting a lot might affect the overall range between charges (some
small amount). But I can’t imagine it even being measurable through MPG on any
vehicle with an internal combustion engine (thus miles per gallon of gasoline).

Re: Problems in a Hybrid vehicle

I'd be
inclined to consider that if not for the fact that when
the radio is idle on a VHF channel it
doesn't affect the MPG.
It's only on UHF where it's a
problem.

I'd also be interested in how the milage
is when the radio is scanning
both UHF and VHF channels.

At the Orlando amateur radio
Hamcation today, I brought up the issue about the radio in the Ford
Hybrid affecting the miles per gallon indication.

One
person (I think was affiliated with a dealership) raised a thought.

The
Calculated efficiency of the system may be a computed by the sum total
energy generated and the sum total energy consumed.

These values
may be obtained by measuring and summing all the individual currents to
and from each device and comparing it with the actual current to and form the
battery, Thus providing a figure of merit of the mileage performance of
the system,

With
the radio connected directly to the battery terminals, Its current load would
not be included in the calculations and affect the MPG vaues. What
happens if the radio is operated from another battery source.

 Kinda
far out but also may be a clue.

That's exactly my problem. It's a newer model. I got it from Import Communications about two weeks ago. Looks like I'll sell it on EBay. This is not acceptable but I understand you get what you pay for.

I have problems with my $600 Yaesu FT8900 so I expect a new
line of anything technologically advanced to have some issues.
I don't think the 5888 was designed this way as you received an
answer from someone else stating he had no problems. And that's
the way I've watched this venture unfold, some quirks are inconsistent
some are. It's too bad that the radio doesn't operate its side independently
or you could have all your decode on the main band and skip them from
scanning on the sub band. But by the time you start adding a lot of
features that stray from the norm, costs go up. Personally, the radio
is workable for me even if decode works properly on the main band.
Maybe you can find a used Yaesu FT8800 dual band. Decent radio
but not part 90 accepted for use on frequencies outside the ham limits.
Good luck in whatever you decide.

Milton.

1138. Offset does not shift transmit frequency in VFO mode

Yahoo group: Anytone_AT-588UV

From: K0BMW
Topic: 1138 Message: 1138

I received my radio that was ordered on November 27. Programming works fine and it works and sounds good. I have two frustrating problems if anybody can help with them.

1. In VFO mode and auto or manual offset active and indicated the transmit frequency is the same as the receive frequency. I have checked and tried just about all of the menu options that might affect this.

2. The software has programming for "TV Radio" with receive only memories. Is there any way to actually access these frequencies?

As I said any help would be appreciated.

1139. Re: [Anytone_AT-588UV] Offset does not shift transmit frequency in VFO mode

From: Milton Hywatt
Topic: 1138 Message: 1139

So basically you are saying the offset does not work in VFO if manual or auto?
And that there is no access to TV Radio frequencies ?

I don't know how to access TV frequencies. Besides that, there aren't any TV audio frequencies being broadcast these days are there? You are using a Massillon Cable email so I'd assume you're in the USA myself being born in Massillon City Hospital now Affinity. I'd love to tell you how to access these but I've not figured it out yet. But again is there anything to listen to besides white noise? Oh and do you use the W8NP and W8AL repeaters?
I might have actually talked to you although I don't know your first name like I only do for so many others. Call doesn't ring a bell either. Hit me up at my email.

Thanks Milton,
That is correct, if I just enter a frequency into the VFO the repeater offset does not work. When I program the channel with the computer it works just fine. The problem being that I can not enter a repeater pair into the VFO in any way that I can figure out.

I will check it out and get back with you in a couple hours.
I got through a couple hundred support questions a day and
they are starting to thin out now so I can get back to the radio.
If you are around you can hit me on Bob's repeater on UHF
if you know who I mean.

73 and hope to work you on Bob's machine. I'll be copying.

1142. "Cannot open communications port" error message

Yahoo group: Anytone_AT-588UV
Date: 2013-02-11 00:00:06 UTC
From: cgalante
Topic: 1142 Message: 1142

I just received my radio and am having trouble connecting it to the PC. I downloaded and installed the software. I made the change to a file to allow the software to open without the radio being plugged in (as Ed suggested). I then installed the USB to comport driver. I rebooted the pc and then attached the radio, which is turned on, to the USB port. I then loaded the software. I confirmed that the set COM was set to com port 7. I then pressed the read from radio button. I got a cannot open communications port error message.

Any ideas what I am doing wrong?

Thanks

First download a copy of FindComPort.exe from Importcommunications.com. Use it to verify what port is assigned to your cable and that the port works. Then set the software to that port.
Win 7 users have some magic to go through sometimes to make USB Serial ports work properly.

Also:
One question: Where did you get the usb to radio cable? Many are knock offs with incorrect chip sets.

1. When you load the usb driver check device manager, com port and make sure there is no "yellow triangle there" 2. Do as John advises below.3. You may have to assign a com port # to the one which you see if you have one available. Right click, properties, comm port, change.
Long ago Ed suggested using Windows XP. I bought 2 XP macines and XP pro, makes hamming so much more simple. I can run Anytone, CHIRP, Yaesu, HL-UV8R , and My Uniden Trunk Tracker off of one machine with no fuss. Plus XP will not assign comm ports way our of range 99% of the time they are assigned as 3, 5, 7, or 9 :)73,GeorgeN5NNS

From: K0BMW
Topic: 1138 Message: 1146

I reset the radio and the VFO repeater offset worked. I reentered the programming from the computer and it stopped working again. After comparing the two states in the computer it seems the problem was in the setup of the Hyper Channels. It is not clear just what they are but the Home mode had to be VFO. Why? But I was able to resolve the problem. Interesting but just something to remember.

1147. General help and suggestions

Yahoo group: Anytone_AT-588UV
Date: 2013-02-11 16:23:25 UTC
From: George Dunagin
Topic: 1142 Message: 1147

By no means complete as no one knows everything.....input always needed and appreciated. And much is my own humble opinion(s).
Saving a few bucks is not worth the headaches in some cases.

1. Use local dealers. If you need to ship back for problems it's quite a trip to China.2. Use dealer supplied cables and software.3. Some usb cable chip sets are bogus and do not work. 4. Antennas: Well, you know there are several. BROAD, DUAL BANDED of course. I use a Moxon beam. I have a few. I made the one I am using from #6 copper ground wire @ Home Depot. SWR is less than 2:1 from 139-160 Mhz (and this can be scaled up or down easily) Say 144 - 170. Just shorten a bit. Simple. Wider banded if you use copper or aluminum tubing/pipe. Plus the antenna works on 440-450 (third harmonic of 2 meters) Another plus is the beam width is about 110-120 degrees :) Good front to back also. There is a great omni on ham universe which is dual band and can also be made from many materials it is a sleeve vertical and can be made with good gain.5. Load the drivers BEFORE connecting the cable to your computer. Then plug the USB in. 6. Know that any radio will have "quirks" it does not matter what brand or how much you spend. 7. Ground everything properly:) So many miss this simple, effective procedure. And strangely but assuredly don't make any ground wire longer than needed and try and avoid 1/4 wave lengths or multiples there of on any band, esp hf. i.e. 20 meters is about 33 feet 1/2 wave so no 16.5, 33, or 49.5 ft ground wires. USE THE SHORTEST POSSIBLE and ground your computer case too.
8. Make sure your various VHF/UHF antennas are a suitable distance apart, vertically and horizontally.
Hope this helps someone :) I read the posts and everyone here certainly helps me!
Thank you,
N5NNSGeorge

The Nevada cell phone laws cover two way radios as well.
http://leg.state.nv.us/NRS/NRS-484B.html#NRS484BSec165
and would seem to outlaw using mics with anything but a PTT button unless there is an emergency

Although the DMV's site seems not to mention the restrictions
http://www.dmvnv.com/dltrafficlaws.htm#laws
Other exceptions include:
*Drivers using citizen band or other two-way radios that require a license and have a separate, handheld microphone.
*Amateur radio operators providing communications services during an emergency or disaster.

1149. Re: Offset does not shift transmit frequency in VFO mode

Yahoo group: Anytone_AT-588UV
Date: 2013-02-11 16:51:21 UTC
From: jwheatleyus
Topic: 1138 Message: 1149

Some menu settings may be the problem. For Offset to work, Menu 2 ARS (auto Repeater Offset) must be ON, Menu 33 Offset Direction must be + or -, and Menu 36 must not be zero. I have Hyper Chan in use and my VFO Offset works normally with the proper Menu setup. Regarding Hyper Channels, they are handy. Once set up, pressing Left Vol selects Hyper 1 and Right Vol selects Hyper 2. To setup, Select Hyper Chan1, set Modes to Channel, put desired channel numbers in Channel, Home Return Channel, VFO doesn't matter. Uncheck Auto Hyper Save. In Function Setup, set Hyper Channel Main to Chan 1. Setup Hyper 2 similarly but with whatever Channel Numbers you want. Now, Press Left Vol and get the channels setup in Hyper 1 and Press Left Vol for Hyper 2. Handy for quickly getting to preset channels. The Vol Press only works in Channel Mode, not in VFO.

1150. Factory Software Request

Yahoo group: Anytone_AT-588UV
Date: 2013-02-11 17:08:13 UTC
From: jwheatleyus
Topic: 1150 Message: 1150

Some, but far from all Menu settings are included in the software 'Function Setup' page. The current software Defaults some of the Menu items when you write to the radio- Example Menu 4 Band ON and Menu55 HandSpkr ON- I usually want both OFF. If the Function Setup included all Menu Items, you could fully control the radio setup with each Write to the radio.
Factory- are you listening?

Try disconnecting the USB cable while rebooting, Windows XP & 2003 would typically treat any "serial" or "serial emulator" device connected at boot up as a mouse and permanently grab the com port.
I have not tested this on Win 7 or Win 8, just habitually disconnect any serial devices I don't want to be mice when I restart my computer.
Good Luck and please let us know if this solves the problem.

>
> I just received my radio and am having trouble connecting it to the PC. I downloaded and installed the software. I made the change to a file to allow the software to open without the radio being plugged in (as Ed suggested). I then installed the USB to comport driver. I rebooted the pc and then attached the radio, which is turned on, to the USB port. I then loaded the software. I confirmed that the set COM was set to com port 7. I then pressed the read from radio button. I got a cannot open communications port error message.

Thanks John,
At least on my radio having Home return not set to VFO does seem to make the difference. I agree the channel set up in the Hyper channels does make for convenient access to 4 channels. The popping of the squelch that I complained of seems to be related to trying to use ctss encoded squelch with the rf squelch- not sure why but they do not seem to play well together.
Thanks for the Help,

Mike K0BMW

Do you own or know someone who owns the qhm-02 mic?

If it has a speaker in it, they's redesigned it since the latest owners manual had been printed. The depiction in the manual doesn't seem to illustrate a speaker.

The state patrol is going to follow the state's revised code as would any local municipality. Most states also disallow mobile communications receivers or transceivers that could receive law enforcement frequencies but exempts licensed amateurs. And it would probably depend on the individual officer, deputy, trooper as to how agressive he or she will enforce Nevada's revised code. Personally I wouldn't worry about getting pulled over. And if you did, you'd likely just be warned or just checked out to see what two way service you were using. Obviously if you were in a commercial vehicle using commercial gear on the job you're not going to get a citation for using your radio. Not sure about CB. I've travels through quite a few states and never heard any chatter on the CB about someone getting cited for using a CB while driving.

The Nevada cell phone laws cover two way radios as well.
http://leg.state.nv.us/NRS/NRS-484B.html#NRS484BSec165
and would seem to outlaw using mics with anything but a PTT button unless there is an emergency

Although the DMV's site seems not to mention the restrictions
http://www.dmvnv.com/dltrafficlaws.htm#laws
Other exceptions include:
*Drivers using citizen band or other two-way radios that require a license and have a separate, handheld microphone.
*Amateur radio operators providing communications services during an emergency or disaster.

Those unique bands can only be programmed and accessed
on one side of the radio. The aircraft bands can only be
accessed on the left side. Not sure but it may be 350 -400
might only be accessed on the left side or maybe the right.

I reset the radio and the VFO repeater offset worked. I reentered the programming from the computer and it stopped working again. After comparing the two states in the computer it seems the problem was in the setup of the Hyper Channels. It is not clear just what they are but the Home mode had to be VFO. Why? But I was able to resolve the problem. Interesting but just something to remember.

I thought this might be useful. I know some have asked if there existed a programming software manual. Forget when I download this but I must have had a lot on my plate at the time to forget about downloading the damn thing. So it might be of some use.

One thing about Windows 7 is it wants to installed the latest/greatest drivers for the PL2303 chip and downloads them in the background from Microsoft's Windows Update repository and install them. So if you use Windows 7 simply disabling your network connection will prevent this and then the driver install dialog will give you the option to not install. Then you would run the driver EXE included in the QSP588 software if you have Import Communications supplied cable. If you purchased from another I have no suggestions. Myself I frequently play USB driver Musical Chairs using multiple USB to serial port cables. I don't know why Windows 7 wants to be such a prick but it is. I have an OLD Radio Shack USB to DB9 serial cable. When I plug that thing in the dreaded ! in a yellow triangle appears on the Anytone cable. Says Error #38 cannot start because another copy of the driver is in memory. So you have to pull the cable, reboot and if your lucky when the USB port enumerates, the current driver will start.

I'm using Chirp on Mac OSX with another PL2303 XA/HXA chip.
You wouldn't believe the hoops you have to jump through to install and verify the driver is in fact installed correctly.

Subject: Re: [Anytone_AT-588UV] Re: "Cannot open communications port" error message

Also:

One question: Where did you get the usb to radio cable? Many are knock offs with incorrect chip sets.

1. When you load the usb driver check device manager, com port and make sure there is no "yellow triangle there"
2. Do as John advises below.
3. You may have to assign a com port # to the one which you see if you have one available. Right click, properties, comm port, change.

Long ago Ed suggested using Windows XP. I bought 2 XP macines and XP pro, makes hamming so much more simple. I can run Anytone, CHIRP, Yaesu, HL-UV8R , and My Uniden Trunk Tracker off of one machine with no fuss. Plus XP will not assign comm ports way our of range 99% of the time they are assigned as 3, 5, 7, or 9 :)
73,

George

Not sure why you get the error but the radio needs to be off before you plug the cable into it and the PC. And don't reboot the PC with the cable plugged into the USB port. Make sure you use the driver software included in the /Program Files/QSP588UV folder. It's the only driver that works with the Import Communications cable. Unplug the cable, run that driver setup and when asked tel it to uninstall previos driver. It will do that then proceed with installing the correct driver. In the Control Panel/Device Manager under the com and lpt ports section, find the Prolific driver and open its properties up. It will show what com port it uses. You can also go into details and the driver date should be 7/2012. I've not found another build of the PL2303 driver that works with Ed's cable.

Hope this helps.

I just received my radio and am having trouble connecting it to the PC. I downloaded and installed the software. I made the change to a file to allow the software to open without the radio being plugged in (as Ed suggested). I then installed the USB to comport driver. I rebooted the pc and then attached the radio, which is turned on, to the USB port. I then loaded the software. I confirmed that the set COM was set to com port 7. I then pressed the read from radio button. I got a cannot open communications port error message.

Any ideas what I am doing wrong?

Thanks

You can program these into your main channel list.
I put 351.000 into the Receive cell and hit enter.
Automatically 400.000 pops up in the Transmit cell.
This will not happen in the More cell at the end of the
channels row indicated by two chevrons >>.
You have to type the transmit in and it seems the first
transmit frequency that isn't out of range is 400 mhz.

So I entered 351.000 355.000 and 400.000 for RX channels.
All of them ended up with 400 mhz TX but since the
radio doesn't TX between 350 and 399.999 mhz it doesn't matter
what's in TX to the radio, only that the software will likely
crash if you get the TX out of range.

Anyway as the channels appear after written to the radio
all three appear on the left side as I thought they would.
But only the 400 mhz channel appears on the right side.
And if you try to program these manually by microphone
keypad input into VFO, the radio will only accept 350 - 399.99
on the left side of the radio.

Forgot, You can turn TX off for these 350 mhz frequencies
in the >> More cell. As I recall you can't leave the TX cell blank,
that would be out of range according to the software so the first
transmittable frequency is 400 mhz according to software. I didn't
attempt a TX there but if you're concerned that you might inadvertently
hit PTT, just turn TX off in the More dialog box.

Just an FYI on USB Serial cables- I have an old HP Laptop running XP. I program Wouxuns, Baofengs, Kenwood, Motorola. When I received the AnyTone, I just plugged in the Ed provided cable, ran the software, and programmed the radio first try. I did not load a new driver. The driver that works on my XP setup for Wouxun and AnyTone cables is Prolific 2.0.2.1 7/25/2005.

Obviously your milage will vary if you use XP, it's not going to fetch the latest WHQL driver like Windows 7. So now I've found another build of' the driver that will work thanks to you. Not sure if it works on Windows 7 but looks like it's fine on XP. What Windows 7 installes is the latest, from 2013 if I recall. People who are not as savvy as you and I often get sucked into this driver vortex for USB connections. The only thing I don't understand is why the process is not a bit smarter as far as the error 38 goes. And I was watching the ports driver list in Device Manager when I plugged in my old Radio Shack cable. Hell I'm using the last driver ever written for it written for Windows 2000 in Windows 7. I plugged that cable and watch the then working PL2303 cable go Error 38. Why that happens? Not sure but I think when a plug and play device is detected it re-enumerates the entire device tree. If the PL2303 cable is plugged in then when it's reloaded even though on the same USB virtual port, it doesn't use the driver that is already loaded. That's got to be a bug in the driver or Windows 7. I used that old USB to DB9 for my old DB9 cables from RTS for my Yaesu radios and it works fine with them. Also works fine with a DB9 - DB25 adaptor on my AEA 232 MBX TNC. But anyway I know how to screw with this and mess with that to get these devices working again. I'm half temped to put XP on that desktop and dual boot. I do use the cable in Vista because that desktop already dual boots to Vista or Windows 7. But I think it behaves similar in Vista. And I have two laptops and a netbook but they are Mac OSX and Windows 7. And I've got a prolific 2303 XA/HXA cable for a Chinese handheld installed in Mac OSX 10.8.2 64 bit with Chirp for Mac. Actually have two drivers, the first wasn't the right one and I'm too lazy to type in commands from a terminal to uninstall it. Also who knows it may work with the Anytone 2303 if one day the 5888UV is supported in Chirp. So I'm pretty sure I've got this crap down now but it's valuable to know that a 2005 driver works with that cable in XP.

To access the 'special bands', use the Left side and set Menu 4, Band, to OFF. Then you can tune the VFO through all the frequencies. If Menu 4 is ON, the VFO stays in a particular band until you Long Press the Tune knob. Long Presses cycle through the bands.
FYI-- If you cycle through the bands, it changes your Hyper Channel 1 setup from Channel to VFO and requires a software change and Write to fix the Hyper Channel 1.

1174. Mounting fron tpanel mount to an AMPS plate

Yahoo group: Anytone_AT-588UV
Date: 2013-02-12 14:39:22 UTC
From: Colby
Topic: 1174 Message: 1174

Does anyone know if the front panel mount is compatible with AMPS mounting plates?

Topic: 1156 Message: 1175

If you just remember to program the radio on the left VFO you'll be fine.
Also remember that aircraft, 350-399 and maybe 220 - 260 will only
appear on the left side as a channel. Don't understand the reason behind
this but I believe they are borrowing this strategy from another dual bander
maybe a Yaesu.

Subject: [Anytone_AT-588UV] Re: 350-400

i think i figured it out sorta. on the left side of the vfo when you program it lets you select the 350-400 or the 220-260. i have no need for it since i cant transmit on those bands nor do i have a reason to do so.

So you want to know the hole spacing? I think it's 1.5 x 1.88 inches but
couldn't swear to it. Maybe someone who has one could measure their?
Or maybe Ed could chime in, he has them in stock.

It's been a while since I signed up here.
Then got really sick.
Anyway, names Ry.

I'm on my smart phone and it wouldn't load easily on my end.
I was wondering if this radio will ever be available anytime soon?
I like the price. It looks pretty good on paper but I'm a new comer to Ham.
So I really don't know too much.

Anyway, if there's any insight to this radio, I'm interested in it.
I'll search messages and see what else I can learn.

Cheers
Ry

I have a mount, but it is a bit difficult to describe. There is a plastic rectangular box that is the exact size of the front of the radio and the head snaps into the box. There is a tang on the back of the box that connects to a flat mounting plate that has five elongated holes. I don't have AMPS dimensions, but I believe the mounting plate can be mounted to just about anything- maybe have to drill a hole or two. My plan is to remove the factory tang and mounting plate and simply mount the plastic rectangular box to an existing radio mount by drilling two holes and using two small screws.

Irv:

That is the same thing I did with my rig in my 2011 Fusion Hybrid. I took a 400+ mile drive to Salt Lake City yesterday and had the rig on 440 band the entire trip. Although it was all highway miles, I did not see any difference in fuel economy, a concern of someone with a Ford Escape Hybrid who stated that he had a noticeable difference in his fuel economy.

1187. Simple Programming of Repeater manually

Yahoo group: Anytone_AT-588UV
Date: 2013-02-13 20:09:52 UTC
From: jimbiram
Topic: 1187 Message: 1187

I have had no problems using the software to program repeaters into the memories. However I'm perplexed how to program anything into a memory for the offsets for a repeater, or to add a pl for such repeater other than by using the software. Does anyone have a simple step by step how-to that they can share? I turned off the Auto Repeater Split so I could enter simplex frequencies via VFO or to program a simple Simplex to memory. Do you have to turn that back on to program manually, and will it change my existing memories?

thanks...

All your programming is done in the VFO. I prefer you do it on
the right side of the radio. Once you are done, save it to a memory.
The radio stores tones and repeater offsets per channel. One of few
global settings is squelch and I think that is set per main or sub band.
There are other global settings but they don't come to mind.

Is that what you needed to know?

The instructions in the owners manual can be somewhat
perplexing. Using word phrasing english speaking people
don't normally use. However I was able to add channels
starting at the VFO level using PL encode and decode
and the automatic repeater offset seemed to work accurately.

I brought a 12 volt supply out in my living room near my
recliner, attached the control head to the remote mounting
cable and radio body and sat back in my recliner and programmed
some frequencies and channels and other set menu items by
hand just so I could answer questions. If you have a future
problem, try to explain it as well as you can and I will try
to recreate it here and offer a solution.

Shame. I, personally, would not wish to purchase an item from a business that would cost me extra due to monetary exchange rates. Don't forget this particular radio is sold in the UK and not the US. As amateur radio enthusiasts I presume that the list participants would like to compare features, quirks, work-a rounds, etc to learn as much about a radio as they can.

I have found this forum very interesting....I want to learn EVERYTHING about this radio; that is the reason I joined. It is nice to know that there are "copycats" out there, and I need to be aware of that when I read something on the 'net. Good AND bad, I want to know the radio, and I was thankful that this information was posted.....

I have found this forum very interesting....I want to learn EVERYTHING about this radio; that is the reason I joined. It is nice to know that there are "copycats" out there, and I need to be aware of that when I read something on the 'net. Good AND bad, I want to know the radio, and I was thankful that this information was posted.....

1201. Cigar plug for ignition power question

Yahoo group: Anytone_AT-588UV
Date: 2013-02-16 13:38:37 UTC
From: Mike
Topic: 1201 Message: 1201

I just installed my radio in the car and I have the radios main power wired up to ignition power, I was hoping that if I left the radio turned on that it would return to its powered on state when power was reaplied, but that isn't the case, so I guess I need the cigar plug to make the radio turn on with the car. My question is if I have both the cigar plug and the radios main power hooked up to ignition power will the radio turn on automatically? Or do I need to have the main power wired for constant power and the cigar plug wired to ignition?

Thanks
Mike

My Anytone powers ON when main 12v is applied. I am not using the cigar lighter cord.

Is there a menu feature that needs to be turned on to get that to work? Right now I leave my radio turn on and when I turn the car off the radio tuurns off. When I turn the car back on the radio does not, I have to press the power button on the radio.

I went out to my car to verify how it works. If the radio is powered Off, then applying 12v does nothing. If the radio is powered On (via the power button) and 12 is removed, then the radio powers back On when power is applied. I am not aware of any Menu setting that would affect this operation. I do have Menu 1, Auto Power set to OFF.

Auto restart is important to me because we plan to use an Anytone as a XBand repeater unattended and it needs to automatically recover from power loss.

The radio needs to be connected to the battery or as close as you can get (constant source).
The cigarette control then will turn the radio on or off provided the plug itself powers on and off with the ignition.

I have noticed that on my radio it will power on some times when power is applied but most of the time it does not. Is this maybe a firmware glitch? All of my other radios turn back on if left in the on position when power is reapplied. Any ideas? Don't want to buy the cigar plug if I don't need it.

25 amps continuous is more than enough by about
10 amps. Powerwerx stuff is usually pretty good stuff
and besides the current rating you should be concerned
about the noise filtering of any SMPS. I think
this one will be a good choice, I use a Diamond
SMPS 30 amp continuous on my HF rig and the AT5888UV.

I think it's more of a glitch. When the input voltage is removed while my radio is on, it does not power back up when the input voltage is restored. If the radio did return to the same state when the input power was restored, the factory would not have designed the radio to power up when the external cigarette plug circuit had 12 volts.

I tried my radio maybe 20 times in a row and it never returned to a power on state on its own without the cigarette plug source.

A. Are you using an external speaker?

B. By your handle, I□m assuming you live in or near New York City? I live in the Metro St Louis area and had issues. Go into the settings and change your RF SQL bump up to S-9 or S-FULL. Then you can also play with the regular SQL settings and see if that helps

Keep trying different combinations. If you□re using a gain type antenna consider going back to ¼ wave antennas

Yes I do. A lot of artifacts can be heard. Not too happy with the audio
quality. Most likely not a problem when used mobile but here in the
shack it sounds a bit dirty.

As I said before it is noisy and I'm not in a high RF environment and
its nothing to do with squelch. I own and operate two of my own
repeaters (2m / 440) and have many other rigs here in the shack so its
only an issue with the Anytone. Artifacts in the audio is what I am
hearing, not interference from other sources unless it is getting
through the RX on this radio and not any other I have. I can almost bet
I am hearing some of the microprocessor too.

A. Are you using an external speaker?

B. By your handle, I'm assuming you live in or near New York City? I live in the Metro St Louis area and had issues. Go into the settings and change your RF SQL.bump up to S-9 or S-FULL. Then you can also play with the regular SQL settings and see if that helps

Keep trying different combinations. If you're using a gain type antenna.consider going back to ¼ wave antennas

The frequency response for the audio system plus the internal speaker is wider than need be for the channel spacing. The artifacts are caused by improper filtration of the audio and the wide frequency response. The artifacts are always present, just better filtered in other radios. You could probably fool around with some different values of non-polarized electrolytic caps across the internal speaker terminals to create a low pass filter. Or like myself, use a communications grade external speaker that doesn't allow reproduction of the audio above the actual human vocal range.

I have two speakers from probably the late 90's. Both are 3.5"
size speakers inside a slightly larger frame that came with a mounting
bracket. One is a Workman K-16: www.palcoelectronics.com/p1001839.aspx
The other is a Barjan 'Diesel' Boomer. You might find it on the internet
if you Google around. I'm pretty sure I bought both at a truck stop.
I use the K-16 on my 5888UV all the time. It's a bit more mellow
toned and I'm using the 5888UV as a base rig. The Boomer does exactly
that. It booms out the audio when you crank it up. Has a 20 watt RMS
power rating and is better suited in the mobile. But either stop the CPU
artifacts from getting to your ears. And neither reproduce PL tones so they
must be bandpassed starting at 150 hz and ending at maybe 500 hz. I'll
have to get out my Leader audio generator one of these days and an old
Shure audio dB meter and see what the bandpass is on those speakers
now that my curiosity is piqued.

His next shipment is after Chinese New Year. That supposedly ends February 25th in 2013. So I would expect some radios back in stock the first of March. Ed is taking preorders and the radios will be shipped in the order the pre orders are received. As far as firmware goes,
I don't think it will be different.

most communication speakers range from about 150 to 5000HZ...maybe a little less than 5000 perhaps 3500.
Often they are designed to have a significant hump between 800 and 1100HZ...right in the middle of the intelligibility range for human speech.
in the case of the boomer, it is probably designed with a lower hump to counter act the mid range engine and road/wind noise that you experience in a large vehicle.

When you consider a voice has a frequency range for a male of 85 - 185 hz
and female 120 - 235 hz one might wonder why the need to go clear up to
5khz for a speaker. And yes there is some mid range accent on the Boomer, it's definitely
made for a big rig and CB. But I used it for years with my Icom 706mkiig in
my SUV. More gain mid point in your voice but with a male talking voice only
having 100 hz bandwidth the gain would be vary narrow. Consider a 5 band
equalizer. Wouldn't work, not narrow enough for voice. That's why I use a Yamaha
31 band mono EQ on my HF rig. And a Symetrix 525 compressor/gate. I might run under
legal limit with a DXE AL-811 but I'm heard loud. I don't like to run like some where
you could hear a mouse walk across the floor in the background, it doesn't do any good
for DX. And definitely no good for voice on a radio that has poorly filtered rx audio.

Speaking of being safe, I spent a night in the Morristown - Hamblen ER back in the 70's
Was coming back from Bristol on 81 to Powell when some woman drove off the berm,
overcorrected, and t-boned us in the oncoming lane. There was nothing left of her 65
Mustang, we were in a Grumman step van converted into a camper. I stretched about
every tendon and muscle in my back, my friend broke an arm. I guess the woman survived.

From: Ken
Topic: 28 Message: 1228

Hi, just getting ready to progam my new radio. The software doesn't look like it will except an inport from another file?

Do I have to enter each frequency in by hand?

Thanks,
WQOJ953

1229. Re: [Anytone_AT-588UV] Audio????

Let's face it. The RX audio on these rigs are very marginal at best. There are a lot of artifacts in the audio.
I put a MFJ "cleartone" Model MFJ281 on the rig, and I thought my ears were going to bleed. Actually made it worse.

Don't laugh, but my "solution" was to put black tape (neatly, mind!) over the internal speaker. This cuts out most of the high frequency krap in the audio
and makes it listenable.

Whenever Ed gets those dual speakers in, I'm going to buy a set to see how they sound.

When you consider a voice has a frequency range for a male of 85 - 185 hz
and female 120 - 235 hz one might wonder why the need to go clear up to
5khz for a speaker. And yes there is some mid range accent on the Boomer, it's definitely
made for a big rig and CB. But I used it for years with my Icom 706mkiig in
my SUV. More gain mid point in your voice but with a male talking voice only
having 100 hz bandwidth the gain would be vary narrow. Consider a 5 band
equalizer. Wouldn't work, not narrow enough for voice. That's why I use a Yamaha
31 band mono EQ on my HF rig. And a Symetrix 525 compressor/gate. I might run under
legal limit with a DXE AL-811 but I'm heard loud. I don't like to run like some where
you could hear a mouse walk across the floor in the background, it doesn't do any good
for DX. And definitely no good for voice on a radio that has poorly filtered rx audio.

□
most communication speakers range from about 150 to
5000HZ...maybe a little less than 5000 perhaps 3500.
Often they are designed to have a significant hump
between 800 and 1100HZ...right in the middle of the intelligibility range for
human speech.
in the case of the boomer, it is probably designed
with a lower hump to counter act the mid range engine and road/wind noise that

you experience in a large vehicle.

Well John, I got to agree with you. I've got dozens of "Comm" speakers in my shop a they all sound crappy. But they do sound ok on my Kenwoods and Icoms. I'm using the Anytone here is my shack as my Icom dual band all mode went south a few days ago. So I'll put up with it for now.

One other problem I brought up a while back was that I can not DTMF from the microphone and get ANY good response from my repeater controller. I can load the 16 DTFM memory channels and they work very well. So what is the difference between directly entering DTFM from the microphone and from the DTMF memory channels? I can either slow code or fast code from any other radio I have with no problem, just this microphone. This is the QHM-05 microphone. Maybe there is a problem with the encoding back to the radio or does it have a DTMF encoder built into the mic? Anyone??

not quite sure where you are coming up with those numbers, but human speech, on average, goes well above 3KHZ for both male and female.
Male, and some female voices go right down to 50HZ and does indeed have energy below that as well.
In fact, most human voices have the most energy between 700 and 1100HZ.
the numbers you said maybe are where you get some humps in the range, but it's certainly not the only place you get significant humps in the overall range.
I work with live sound production and studio vocal production all the time, and believe me, the human voice/speech range is definitely not limited to low frequencies...it sits right up there in the low mids and mids.

I have two speakers from probably the late 90's. Both are 3.5"
size speakers inside a slightly larger frame that came with a mounting
bracket. One is a Workman K-16: www.palcoelectronics.com/p1001839.aspx
The other is a Barjan 'Diesel' Boomer. You might find it on the internet
if you Google around. I'm pretty sure I bought both at a truck stop.
I use the K-16 on my 5888UV all the time. It's a bit more mellow
toned and I'm using the 5888UV as a base rig. The Boomer does exactly
that. It booms out the audio when you crank it up. Has a 20 watt RMS
power rating and is better suited in the mobile. But either stop the CPU
artifacts from getting to your ears. And neither reproduce PL tones so they
must be bandpassed starting at 150 hz and ending at maybe 500 hz. I'll
have to get out my Leader audio generator one of these days and an old
Shure audio dB meter and see what the bandpass is on those speakers
now that my curiosity is piqued.

The frequency response for the audio system plus the internal speaker is wider than need be for the channel spacing. The artifacts are caused by improper filtration of the audio and the wide frequency response. The artifacts are always present, just better filtered in other radios. You could probably fool around with some different values of non-polarized electrolytic caps across the internal speaker terminals to create a low pass filter. Or like myself, use a communications grade external speaker that doesn't allow reproduction of the audio above the actual human vocal range.

When you consider a voice has a frequency range for a male of 85 - 185 hz
and female 120 - 235 hz one might wonder why the need to go clear up to
5khz for a speaker. And yes there is some mid range accent on the Boomer, it's definitely
made for a big rig and CB. But I used it for years with my Icom 706mkiig in
my SUV. More gain mid point in your voice but with a male talking voice only
having 100 hz bandwidth the gain would be vary narrow. Consider a 5 band
equalizer. Wouldn't work, not narrow enough for voice. That's why I use a Yamaha
31 band mono EQ on my HF rig. And a Symetrix 525 compressor/gate. I might run under
legal limit with a DXE AL-811 but I'm heard loud. I don't like to run like some where
you could hear a mouse walk across the floor in the background, it doesn't do any good
for DX. And definitely no good for voice on a radio that has poorly filtered rx audio.

most communication speakers range from about 150 to 5000HZ...maybe a little less than 5000 perhaps 3500.
Often they are designed to have a significant hump between 800 and 1100HZ...right in the middle of the intelligibility range for human speech.
in the case of the boomer, it is probably designed with a lower hump to counter act the mid range engine and road/wind noise that you experience in a large vehicle.

Subject: Re: [Anytone_AT-588UV] Audio????

I have two speakers from probably the late 90's. Both are 3.5"
size speakers inside a slightly larger frame that came with a mounting
bracket. One is a Workman K-16: www.palcoelectronics.com/p1001839.aspx
The other is a Barjan 'Diesel' Boomer. You might find it on the internet
if you Google around. I'm pretty sure I bought both at a truck stop.
I use the K-16 on my 5888UV all the time. It's a bit more mellow
toned and I'm using the 5888UV as a base rig. The Boomer does exactly
that. It booms out the audio when you crank it up. Has a 20 watt RMS
power rating and is better suited in the mobile. But either stop the CPU
artifacts from getting to your ears. And neither reproduce PL tones so they
must be bandpassed starting at 150 hz and ending at maybe 500 hz. I'll
have to get out my Leader audio generator one of these days and an old
Shure audio dB meter and see what the bandpass is on those speakers
now that my curiosity is piqued.

in the case of telephones, the equipment at the time didn't support anything wider than 300 to 3000HZ
unfortunately, that hasn't changed even today, so that's why telephones sound almost identical in audio quality to what they did in the 30's.
if you ever get a chance to listen to old telephone recordings, they really don't sound allot different than our most modern phone audio...including cellular.

From: George Dunagin
Topic: 1212 Message: 1239

On the audio, I live in a fairly rural area, about 3 miles N. Of Hendersonville and 15 air miles south of Asheville, NC and have not noticed any audio distortion or artifacts, Squelch is set on 4, operation is at base not mobile. I will try a few speakers and see if there is a difference.
73,
George

not quite sure where you are coming up with those
numbers, but human speech, on average, goes well above 3KHZ for both male and
female.
Male, and some female voices go right down to 50HZ
and does indeed have energy below that as well.
In fact, most human voices have the most energy
between 700 and 1100HZ.
the numbers you said maybe are where you get some
humps in the range, but it's certainly not the only place you get significant
humps in the overall range.
I work with live sound production and studio vocal
production all the time, and believe me, the human voice/speech range is
definitely not limited to low frequencies...it sits right up there in the low
mids and mids.

Audio????

When
you consider a voice has a frequency range for a male of 85 - 185
hz
and
female 120 - 235 hz one might wonder why the need to go clear up
to
5khz
for a speaker. And yes there is some mid range accent on the Boomer, it's
definitely
made
for a big rig and CB. But I used it for years with my Icom 706mkiig
in
my
SUV. More gain mid point in your voice but with a male talking voice
only
having
100 hz bandwidth the gain would be vary narrow. Consider a 5 band
equalizer.
Wouldn't work, not narrow enough for voice. That's why I use a
Yamaha
31 band mono EQ on my HF rig. And a Symetrix 525 compressor/gate. I
might run under
legal limit with a DXE AL-811 but I'm heard loud. I don't like to run
like some where
you could hear a mouse walk across the floor in the background, it
doesn't do any good
for DX.
And definitely no good for voice on a radio that has poorly filtered rx
audio.

most communication speakers range from about 150
to 5000HZ...maybe a little less than 5000 perhaps 3500.
Often they are designed to have a significant
hump between 800 and 1100HZ...right in the middle of the intelligibility range

for human speech.
in the case of the boomer, it is probably
designed with a lower hump to counter act the mid range engine and road/wind
noise that you experience in a large vehicle.

Re: [Anytone_AT-588UV] Audio????

I
have two speakers from probably the late 90's. Both are
3.5"
size
speakers inside a slightly larger frame that came with a
mounting
bracket.
One is a Workman K-16: www.palcoelectronics.com/p1001839.aspx
The other is a
Barjan 'Diesel' Boomer. You might find it on the
internet
if you Google around. I'm pretty sure I bought both at a truck
stop.
I use the K-16 on my 5888UV all the time. It's a bit more
mellow
toned and I'm using the 5888UV as a base rig. The Boomer does
exactly
that. It booms out the audio when you crank it up. Has a 20 watt
RMS
power rating and is better suited in the mobile. But either stop the
CPU
artifacts from
getting to your ears. And neither reproduce PL tones so they
must be bandpassed
starting at 150 hz and ending at maybe 500 hz. I'll
have to get out my
Leader audio generator one of these days and an old
Shure audio dB meter
and see what the bandpass is on those speakers
now that my curiosity
is piqued.

1240. More on Controlling Power On

Yahoo group: Anytone_AT-588UV
Date: 2013-02-18 15:57:44 UTC
From: jwheatleyus
Topic: 1240 Message: 1240

If my radio is powered On and I remove the 12v, and then 12v is restored, the radio powers up in Hyper Channel 1 (I have it configured for Hyper 1). I decided to try using the Acc connector on the rear- the cigar lighter turn on accessory. On my radio, the Acc connector has absolutely NO effect. The only thing that affects radio turn on is application of main 12v. If my radio is Off at removal of 12v, then it remains Off when power is reapplied. If the radio is On at power removal, then the radio powers On when power is reapplied.
Another surprise feature.

I tried to recreate this with two radios. Neither powered back on after removing the supply voltage while the radio was on. However I do remember my Yaesu FT8900 powering on as you describe but it wasn't consistant. Maybe for the 5888UV it's something unique to how you have it programmed.

Wow John that's really odd. Another oddity I've found is the ext spk jack is reverse from the drawing in the manual. The manual depicts the radio upside down rear view. And the lower 3.5mm jack the ext speaker. That is incorrect. The top 3.5mm jack with the radio upside down rear view is the ext speaker jack. I have two radios. One from the first 50 exported as a 5888 and the second late January. Both are the same in regards to the spk jack assignment. So it comes as no surprise the AUX power input to switch the radio might not be correct. I will make a plug tomorrow and test it for myself and publish the result.

Thanks so much for your help. It really serves the owner community that all owners report these oddities.

I just installed the 5888UV software last night (on Win 7) and was able to modify the mysetup.ini file just fine.

If you installed the software with admin capabilities, but your regular user is not an admin, that may be your problem. You'll need to use an admin login (depends on how you setup your pc) to get around this.

Looking at the file properties, security tab will help - you can at least see the types of users who have write access. :)

I installed last night and that's what I've seen so far as well.

Save frequently. I can tell this is a "young" program - it doesn't handle input errors gracefully right now (crashes).

I had to giggle a little last night though as I was setting up the first time. I'm not used to thinking of the repeater offsets in terms of rx/tx frequencies (ok, I had to do math late evening). The setup was pretty easy once I realized what fields needed which values (I'm coming from a Yaesu background).

1252. Re: Simple Programming of Repeater manually

Yahoo group: Anytone_AT-588UV
Date: 2013-02-19 17:25:26 UTC
From: debbywx9vor
Topic: 1187 Message: 1252

From what I found last night when I was taking my first shot at setting up (I'm going to test this morning fyi):

offset --> instead of putting in + or - .6 etc., you have to put in
the rx and tx frequencies explicitly
i.e. if your repeater is heard on 147.210 (rx for your
radio) and has a - .60 offset, your transmit (tx) freq
would be 147.210 - .600 = 146.610
pl tone --> check to make sure, but usually this means your repeater
is using CTCSS (instead of DCS) to sort out which
transmission to repeat.
Right now I've got "CTCSS/DCS Encode" and
"CTCSS/DCS Decode" set to "CTCSS" with both frequency
drop-downs to the right set to my repeater's PL Tone
(103.5 - it will vary by repeater).

This is where having a ARRL Repeater Directory guide is handy.

I have also set the "Squelch Mode" to "CTCSS/DCS" on my repeater entries.

Anyone who has this working already, please let me know if I'm on target here.

Thanks!

However I'm perplexed how to program anything into a memory for the offsets for a repeater, or to add a pl for such repeater other than by using the software. Does anyone have a simple step by step how-to that they can share? I turned off the Auto Repeater Split so I could enter simplex frequencies via VFO or to program a simple Simplex to memory. Do you have to turn that back on to program manually, and will it change my existing memories?

Just a suggestion -- but using CTCSS/DCS Decode is usually a bad idea.

It is NEVER necessary.

Most repeaters require a CTCSS tone on the incoming signal to enable the repeater to pass the signal. (That's what CTCSS Encode is for).
A few repeaters (very few ham repeaters) require a DCS code on the incoming signal (that is what DCS encode would be for).

Lets talk about CTCSS which is more common (DCS works in a similar way but the details are slightly different). In each case, we will accuse that the repeater requires a CTCSS tone on the incoming signal before it will repeat that signal:

1. The repeater may simply allow the incoming signal to pass through the repeater without filtering or adding anything. (This is the most common situation.) In this case there should be the same CTCSS tone on the repeater output, but due to the audio circuitry of the repeater, the tone being passed through is often weakened. This can make the CTCSS tone on the repeater output unreliable, especially if the original input signal was marginal to begin with or if the receiving station is far enough away to be getting a poor signal from the repeater. Using CTCSS Decode in this case will probably work most of the time, but may not work all the time.

2. The repeater circuitry may deliberately filter off the subaudible CTCSS tone from the input signal before passing it through. What happens next offers three different possibilities:

2a. The repeater may repeat the input signal without any subaudible tone. In this case CTCSS Decode will result in you not hearing anyone on that repeater.

2b. The repeater may regenerate the same CTCSS tone on the repeater output. In this case CTCSS Decode will work perfectly all the time (unless you are so far away that you barely hear the repeater at all).

2c. The repeater may generate a _different_ CTCSS tone on the repeater output. (This is still rare, but is being seen more often in some areas). In this case CTCSS Decode will work perfectly IF AND ONLY IF you have the different encode and decode tones programmed properly.

In every one of the above cases, you will hear the repeater at least as well with CTCSS Decode OFF.

Here in Southern California where I own and operate two repeaters, one on 2M and one on 440, I strip the incoming CTCSS. I send out the same CTCSS from my system. Then main reason to use CTCSS decode squelch is that there are too many other machines that are coordinated on the same frequency as I am assigned. So for the folks who are on my repeaters who don't want to listen to another repeater miles away they can turn on their CTCSS decode squelch. That is the nature of the beast here in such a crowded area. As anyone who lives here should know.

I use tone decode on channels I do not wish to hear
repeters ID. Also in the public service bands it is some
times a must to decode because of interference from
nearby agencies sharing the same national frequency.
There is one frequency here shared by five different
fire and EMS agencies, all separated by unique tones.

I also you encode/decode on my crossband repeater and
hand held. Keeps unwanted signals from bringing up my
cross band repeater and the repeater it's linked to. And some
times when band conditions are right we get a lot of VE stations
in from Canada and turn on decode. So you see decode is
useful but for amateur use, it's usually applicable in certain
situations.

I've been using the software since December and yes it's early, still in beta.
There are certain routines you have to follow to keep it from crashing.
The biggest is when you modify a file and write to the radio, save the file
as is or as a newer edit in a sequence. Use the current date and a letter
before the .dat like 2-19-13.a.dat 2-19-13.b.dat and so on. Save them in
the folder the program lives in because it will always look there first when
you tell it to open a file. So save the file, then write to the radio. As long
as I do that, I never get a crash. Another crash comes from a "frequency
out of range" error. Not always but often enough. If you enter your
frequencies in the main channel list by double clicking on the RC cell
the program will automatically put the offset in the transmit cell. Don't
remember if auto offset has to be enabled in the software but I think it
does. The software will not put an out of range value in the TX cell. It
might not put the right one in there but at least the program won't crash.
On Windows 7 I've also noticed that in the compatibility mode
running the program as administrator and in the Windows XP SP3 mode
keeps the crashes down to just a couple circumstances.

Sounds like you're on your way. Get to know the radio. It has
quirks but my $600 Yaesu FT8900 shares a few of the same quirks.

I'd hate to have to listen to one fire dispatch frequency shared by several
departements for maybe a 75 lime radius without decode. It would be
constant traffic when all I wanted is one county fire department. Same
goes for the HEAR frequency for ambulance to ER and back. Not so
much used but was for decades. Without decode it would have been
unpleasant to attempt to listen to.

Any other questions, feel free to ask, we're finally getting to know our
radios inside and out. And there are a few here that can answer just about
anything you need to know about, even more so than I the group owner
and in possession of two AT5888UV radios.

Milt.

I would suggest caution in use of Stun or Kill as you may do it to yourself. If you are involved with 2 or 5 tone signalling systems, those features may be helpful. If you are not familiar with such systems, they may not be very important to you

You need to talk with your radio systems administrator (police department, EMS, Fire, etc.) to see whether you need to set up these 'SELCAL' (Selective Calling) features to talk through their systems.

How are you using this radio?

cheers,
Bill

From: William (Bill) Wallace
Topic: 1257 Message: 1263

The last user that wanted to see for himself how to use the Stun/Kill features apparently bricked his radio and had to send it back for factory reprogramming. No there is not any documentation on these features as of now that anyone has found and discussed on the group. Search the group messages for the prior discussion of Stun and Kill and you will find the messages I am talking about.

Here is info on Selective Calling that may help.
http://en.wikipedia.org/wiki/Selective_calling
We use 2 Tone for an EMS/Fire alert. The HTs are programmed to receive a tone pair and the Central Dispatch transmits the tone pair to get attention.

Best not play with STUN, KILL and REVIVE features unless your department requires them. These security features enable dispatch to remotely temporarily disable (STUN) or permanently disable (KILL) your radio should it fall into the wrong hands. On the AT-5558UV the REVIVE function is called Remote Wake Up. These security functions are accessed by sending a unique 5 Tone DTMF sequence to the radio that was pre-programmed to respond to those unique 5 tone sequences by disabling itself. I repeat, do not play with these functions unless instructed by your department's security administrator.

Icom and Vertex among other mfg's use these features on their professional radios. Google is your friend. Try searching for '5tone kill stun'

1266. Misc Issues

Yahoo group: Anytone_AT-588UV
Date: 2013-02-21 16:29:59 UTC
From: Mark
Topic: 1266 Message: 1266

Questions for the group.
1. Weird noises coming into both the Hand Speaker and the radio speaker. It makes the noise when you adjust any of the knobs, make changes to the radio and continous bursts while in scan. Sounds a lot like processor noise feeding back through?

2. Radio will not do V/V or U/U receive?

3. Is there a way to send version of firmware is on the radio?

Thanks,

1267. Re: [Anytone_AT-588UV] Misc Issues

Not sure if you can actually get a firmware
number but the software will show the date.
Besides the main channel display, there are
two or three under that, one for the set menu
items than the last one will give the radio date.
Or there is a "about the radio" tab somewhere.
I don't remember exactly but look around in the
software after you have read from the radio.
I won't have a precise answer until later when I can
get to the PC that is running the software.

I would like to correct Mr. Wallace, I am the user that played with the remote kill feature and did lock up my radio. However there is software available in the software area of this group I believe, that does reset the radio back to a active or normal state. You do not have to send the radio back to reset it. I have not played with the remote stun yet but will check it out when I have time. Hope this helps. Not trying argue with anyone just wanted to let everyone know.

The stun and kill toning setup is in the software under 5Tone. Upper right there is a Information 1
setting (I think that's what it's called) and when you drill in on it it gives you the options like
Stun Kill Awake etc... On this list in the Files section I put up a file for the software instructions.
It may or may not show ou how to set up 5Tone however if you do manage to kill or stun the radio
it takes special software to revive the radio. Just keep that in mind.

The software to revive a stunned radio is no longer on this list.
The Anytone people asked me to remove it after a couple whiners
here complained about it.

The help file in the programming software for the Wouxun KG UV920P includes some explanation of what Stun and Kill are supposed to do. It also tries to explain how to use them, but the explanation is in the “English” typical of Chinese radio products.

I have the noise also. The audio isn't filtered that great.
I use an external speaker designed to boost the mid
range frequencies and attenuate the lows and highs.
It gets rid of the noise. I should scrounge up some
non-polar caps and see if I can lower the upper end
of the band pass at the speaker. The mic speaker makes
even more noise, I guess because it's smaller and has a
higher frequency response. And yeah be careful with
the squelch and modes. I get by with carrier squelch
just fine. But you can have both carrier and rf enabled
at the same time. That probably isn't a good idea.

Date: 2013-02-28 19:37:03 UTC
From: Milton Hywatt
Topic: 1281 Message: 1282

Shouldn't have to do anything to get the radio to dual
UU/VV/VU/UV receive. If it doesn't receive VHF on
both sides the radio is faulty. I can't be sure of that not
knowing for sure if the 270M is a copy, rebranded 5888UV,
clone or what. But whatever it is, it should do all dual receive
modes out of the box.

Hello all
I own a Anytone clone (CRT 270M) and I don't manage to receive V/V simultaneously on main band and sub band while It works perfectly for U/U for instance.
Do you know if I have to change something in the menu (I turned the menu MUTE to off but It doesn't work)
Thanks
Damien

Like I've already mentioned the KILL and FAINT settings are in the
5Tone section of the software. I have uploaded a guide for the software
at groups.yahoo.com/group/Anytone_AT-588UV/files/
under AT5888UV Literature. Don't know what good it will do you for
these features but have a look.

I am in the process of setting up a remote base on Amateur bands (with auto IDer) and could make use of these features if the remote was used maliciously by an unauthorized party. So, I am my department's security administrator and need to know how to use the feature of the radio that I purchased for this purpose :)

--- In Anytone_AT-588UV@yahoogroups.com, "williamahinds" wrote:
>
> Best not play with STUN, KILL and REVIVE features unless your department requires them. These security features enable dispatch to remotely temporarily disable (STUN) or permanently disable (KILL) your radio should it fall into the wrong hands. On the AT-5558UV the REVIVE function is called Remote Wake Up. These security functions are accessed by sending a unique 5 Tone DTMF sequence to the radio that was pre-programmed to respond to those unique 5 tone sequences by disabling itself. I repeat, do not play with these functions unless instructed by your department's security administrator.

1284. Regarding DTMF/2Tone/5Tone signaling

Yahoo group: Anytone_AT-588UV
Date: 2013-02-28 20:22:12 UTC
From: Milton Hywatt
Topic: 1284 Message: 1284

A while back there was a user having a need to use 2Tone signaling. We had some dialog in email and determined that there was something faulty with the mode. A channel programmed for say 5Tone according to the users manual was supposed to tone when you pressed the PTT. Well this is incorrect. I don't know how I could have missed it but it states clearly in the owner manual you have to also press the UP button on the microphone after you press and hold the PTT. I've been through that manual a dozen times and today was looking for some 5Tone info and came across this info on the first Shortcut page 13.

Glad you got it fixed. It's possible you might have
done something to interfere with the VHF audio
only but skimming through the manual I couldn't
find anything that wouldn't disable audio for only
one band. Now say you were using RF squelch
on both sides and it was jacked up to full, then
unless you were on top of a signal you wouldn't
hear anything or see a meter reading. But that would
affect the side of the radio, not the band. Most times
a good old fashion factory resume cures these oddball
anomalies.

Hi Gang,
Hopefully many of us will receive the Feb shipment to US from China in March.
To avoid screwing the set up with Anytone software would a few draft files be available to post? I want to make sure that I am setting this rig up correctly since it has so many options and settings. A few sample US files would be appreciated.

Milton RE: This is a follow up on the previous message.
I am having a terrible time down loading and printing the most recent AT-5888UV operating manual. I have had my transceiver for two weeks and have yet to get it on the air. I had an original manual in the machine, but it would print pages etc out of order so I recently tried to purge the old stuff out, (think I got it).

Now how do I start over ? I am running XP.

Apparently the manual requires 3 downloads, because of it's size. Do I have to have a CD disk or thumb drive to do this ?

Do I need to down load another extraction file ?

Sorry to be making such an issue over this.

I seem to have the same "clicking sound on some channels that comes from both the mic speaker and the base unit as well. Sometimes the radio is quiet, and suddenly the clicking starts, and often it is in the background on channels with traffic. I thought about opening the mic, but today I noticed it is also coming from the base unit. Is this a squelch related issue or is there a defect in the firmware or the receiver?

So we're talking about two different things. If I recall
first you wanted the software manual that gives you
some hints as to how to use the programming software.
Now it seems you want a file of the owner's manual that you
can view on your PC. That file is available at importcommunications.com.
Scroll down below the Baofeng F-11 picture and click on the
Anytone picture. scroll down that page to Software and Manual.
Click on the owner's manual and it will begin to download and
will be located wherever your browser is set to download to.

A lot of these anomalies can be corrected or at least
minimized by performing a factory resume. The first
50 units off the line were horribly buggy. Mine was
#39 and it couldn't be used in dual band mode because
the main band and sub band interfered with each other
especially while scanning. The next radio I got was #289
off the assembly line and it performs almost as well as
my Yaesu FT8900 but it still has some odd problems.
I imagine a 3rd iteration of firmware update might smooth
the rest of these things out but the firmware is not field
uploadable. It has to be done by a dealer with a special
device inside attached to the inside of the radio.

Remember these are NOT ham radios. They are Part 90
certified LMR (land mobile radios) intended for business
use. The business owner does not really want the employee
screwing around with custom settings, flashing the firmware etc...
This is why some of these Part 90 radios are a real pain in the
arse to program without software. My Baofeng F-11 HT
extremely hard to program manually. With software I can even
defeat the Menu button using the programming software giving
the user of that radio ZERO chance to change settings. And that's
why Wouxun makes a basic model with no keypad, software
programable only. So other that these issues, the 5888UV
does work as intended for the most part. I do see an issue
with the receiver being very hot but the radio lacking either
in filtering by design or by the quality of the parts they're using.
This could lead to some adjacent channels and intermod interference
in a high RF environment.

I seem to have the same "clicking sound on some channels that comes from both the mic
speaker and the base unit as well. Sometimes the radio is quiet, and suddenly the clicking
starts, and often it is in the background on channels with traffic. I thought about opening
the mic, but today I noticed it is also coming from the base unit. Is this a squelch
related issue or is there a defect in the firmware or the receiver?

The radio is shipped with an owners manual so no you
don't have to pay for it. And I gave you instructions on
how to download the latest owner's manual. One thing I won't
do is troubleshoot printing issues.

□

How do I print the latest applicable operating manual for
my Anytone 5888AU machine.

I have tried to print several downloads, (both sides) and
the pages get all screwed up with missing sheets, etc.

Since I have purchased the product, do I have to pay an
additional charge for the manual in order to use it ?

Thanks

Don Jeerings KI4EFL

The cable program down loaded OK

If you mean the HM buttons on the front panel of the mic button programmed for Home, no. It would have to be done via software but there is nothing in the software for programming them with a specific frequency.

There are audio 'artifacts' under certain conditions. On my radio, the 'Main' channel has clean audio, but the 'Deputy' channel has the noise clicks.
Also Rx Tone decoding only works on the Main channel. The Deputy channel only has Carrier Squelch. Not a show stopper, but a real annoyance. They did not do much testing during development, or they do not really understand how radios are used.

The decode issue is reported to be fixed by the latest firmware upgrade. Also, it seems only to happen if both sides are on the same band. If they are on different bands then the sub-band CTCSS squelch works fine - at least on my radio.

I think the design team didn't put a lot of effort into the use of the radio for amateur. It is after all an LMR. But I won't make excuses, I don't care for some of these anomalies. And if like me, you often scan both bands you are constantly switching from UU to UV to VV to VU etc...
So if you are not scanning and say the main is U and the sub is V, then the tone decode should work as designed. This and the clicks caused by U frequencies mixed in with V frequencies scanning on the Main band and you are receiving a V channel on the sub, that's where the clicks come from on my radio. And I have determined that it is when a U channel passes by in a mixed set of U and V channels. If I skip the U channels the audio is clean on both sides. However I get similar results on my Yaesu FT8900. But reverse. It's when a V channels scans by on the opposite side receiving a V channel. So yes it's annoying. And who knows when a fix will be ready for this. All I know the radio will have to be packed up and sent somewhere where they have a firmware updater, it's not updateable by the end user unless you could get the updater dongle and the firmware image.

1308. Updates From Ed @ Import Communications

Yahoo group: Anytone_AT-588UV
Date: 2013-03-07 03:07:44 UTC
From: Anytone_AT-588UV-owner@yahoogroups.com
Topic: 1308 Message: 1308

OK here is the latest. New AT5888UV radios should arrive at Ed's around March 25. There are a total of 70 pieces. They should go out by 5 days later.

All radios having issues with PL decode on UU/VV operation can be flashed to correct this issue however the radio will need to be shipped back to Ed at owner's expense.
The newest shipment of radios will have the latest and updated flash. (personally I'll be sending both of my radios back to Ed to flash, USPS priority isn't too expensive so it will be worth it to then have a perfectly operating radio.)

All outstanding orders like I said should hit the streets by March 30 and will boast the newest firmware as will all newer orders. So feel free to order a new radio, I'm sure it will exceed your satisfactions.

Ed's also got some exiting new products coming out in the near future, some of course I will be putting through their paces this time before they go on the market so we can eliminate the need for all these firmware updates. Once I know the particulars
I'll be starting a new Yahoo list for those whop have interest.

Milton, list owner

1309. Dealers comming to the Charlotte NC hamfest ?

Ed tells me he will have radios around March 30 to fill 70 outstanding orders. These will have the latest firmware to correct the PL encode on UU/VV dual operation. Also some minor issues and improvements. I think Ed said he has the latest firmware that will correct the PL decode on those that have the problem and need their radio to work with PL decode in any dual rx configuration. So if you want the new firmware get your radio shipped back to Ed. Unless he's super busy, I'd expect turn around to be 3 - 5 days.

These 70 have already been sold, Ed probably bought 100 to get a good price so he might have 30 for sale, I'm not sure about that. And if you buy a radio from Mike, what firmware will it have? As far as I know Ed has the only firmware flashing tool in the US. And he won't flash radios not purchased from him.

Milt- Do you know if the new firmware resolves the problem of clicking noise in the Deputy channel on receive? If I have two UHF channels and have the Left set as Main, then receive on the right has random clicking noise that is almost like real noise except it goes away if I switch Main to the right side.

I do not know that. I do know I've sent video to Anytone demonstrating this. And there have been several well written emails documenting this and other oddities. Language and meaning translation has always been an issue and when you try to explain to their engineering department you try to do it as if they are 4 year old kids. I've told them this problem I've found to occur when the radio is set as you describe and clicks when a UHF channel scans by. If you scan just VHF, there is barely any detectable clicking. However it seems you are saying you are in standby mode in UU dual receive and you get clicking. My experience is with scanning the sub band and listening to the Main band while receiving VHF signal. I'll recheck that later but I'm pretty sure that's what my radios do. But regardless Anytone is aware of this. Not sure if it was fixed yet. One thing though, my high dollar Yaesu FT8900 makes some clicking noises while receiving on the main band and scanning on the sub. But only when a VHF channels scans past. And regardless which side is sub or main. But it is just barely noticeable, actually unless you were looking for it you might not notice it. So I think that dual receive radios are just susceptible to this. I don't have another brand I can try though so it's all guess work for me.

In my case, no scanning is involved. Just two fixed UHF channels and when the Deputy receives, there is the clicking. I have not tried it with VV or UV.

Does the click happen once while the squelch opens
on the other channel or does it continue? I wouldn't
consider a single click on the deputy channel to be
a big deal. However a continuous clicking would be
a big deal. Try it in some different UV/VU/VV
configurations.

In my case, no scanning is involved. Just two fixed UHF channels and when the Deputy
receives, there is the clicking. I have not tried it with VV or UV.

It is not a single click. It is continuous and sounds much like weak signal noise but it is on a strong signal and it goes away when on Main channel.

Ok so it is a continuous click on the sub band when in UU mode?
I'm still not following you I guess. Are both sides in standby or is
once side receiving? Does the s-meter show a spike when the click
comes? Try to be as precise as possible. I'm not usually a dense person
but I'm having trouble picturing this so I can go set a radio up to
try to mirror the problem on this end. And I have two different radios
with two different firmwares and even a third removable control head
with a prototype firmware in it.

Ok got it. You're calling the sub band Deputy. Ok I'll give it a try.
One or two final things, is this a certain pair of UHF channels?
Are these amateur frequencies or LMR frequencies, and are they
carrier, RF, or tone decode squelch.

Oh and in addition, I listen to a law enforcement agency
that covers a large township. And for law enforcement
they use one frequency pair for their repeater but split
coverage of a couple different villages (people with megabucks
who have their own township patrol) two large shopping
malls and strips, and regular road patrol all separated by
digital code squelch. It works ok because there isn't a constant
flow of traffic or else everybody would stomp on each other
and that does happen occasionally. However I'm listening to a
non-PL ham repeater on the deputy side and haven't heard any
clicks. So send me off list the freqs and tone codes and I'll simulate
here.

These are two LMR frequencies, digital tone, both are repeaters. I have not had an
opportunity to try various combinations of LMR, Amateur, UV, etc. These two channels are
key Ski Area channels that I monitor regularly, so I really notice the noise.

If I have two UHF channels and have the Left set as Main, then receive on the right has random clicking noise that is almost like real noise except it goes away if I switch Main to the right side.

Has anyone put their radio on a station monitor and checked the power output across the bands? If so does it put out full or close to full power all the way across? I only ask because I saw posts about a competing radio that puts out 50 watts on the ham band and only 4 watts when outside the ham bands.

Since I look at this radio as a LMR radio that just happens to also cover the ham bands it's most important to me.

This may have been answered a while ago and I just don't remember nor can't find it farther back in the group.

I've had two radios on a General Dynamics R8000 and TX is more like 55 watts on VHF and 43 on UHF consistently across its coverage into a none radiating 50 ohm dummy load.

Tried to recreate the noise but failed. Must be unique to your radio.

Ok, that's where I had it this morning. On a General Dynamics R8000.
I started out at -130 dbm and increased the signal to around -60 dbm.
1K test tone deviated to 12.5khz. Dropped the tone freq to 300hz, raised it
to 3khz. Nothing I could do to recreate the noise. If you can do it, make an
MP3 of it and email it to me. Or even a phone video showing the radio's
front panel and maybe the parameters of whatever test set you use.

From: John McLean
Topic: 1338 Message: 1338

I know this isn't the group for the single band AT588, but I need help. As there is no retailer in Australia I purchased an AT-588 UHF radio direct from China. Only problem is that the frequency is locked from 400 to 469 Mhz despite the radio being advertised as being good to 490 Mhz. Anyone got any information on how to change the range?

By the last three digits that likely means it is the 212th radio to be finished and boxed up for sale. So if my hunch is right that radio would need a firmware update to correct the PL decode problem on the sub band. My newer radio is 285 and has that particular problem.

From: sv1eex
Topic: 1340 Message: 1340

Hello everybody.

I am a pleased owner of the AT-588UV, got it a few hours ago. I was wondering what this usb port on the left of the detachable screen is all about. It is certainly not documented into my manual and it seems not to be for the programming usb interface (it has an RJ-45 like connector for the microphone slot on the rig's side).

Hope it does more than charging any 5V device...

73 de sv1eex - Nik

Subject: [Anytone_AT-588UV] USB port of AT-588UV

Hello everybody.

I am a pleased owner of the AT-588UV, got it a few hours ago. I was wondering what this usb port on the left of the detachable screen is all about. It is certainly not documented into my manual and it seems not to be for the programming usb interface (it has an RJ-45 like connector for the microphone slot on the rig's side).

Hope it does more than charging any 5V device...

Good luck. I know it's a pain in the ass to box it up
and send it back, I'll be doing that soon with my
serial #019 radio. It's so screwed up I can only use
it mono display. Ed sent me the replacement mic preamp
board That took care of the over-compensated AGC on the mic.
Hopefully a fresh firmware update will make it dual usable.

Milton.

Solved the problem, a small software program fixed it.

1346. Remote mount the 5888

Yahoo group: Anytone_AT-588UV
Date: 2013-03-16 20:26:34 UTC
From: kd0rsw
Topic: 1346 Message: 1346

I purchased a 5888 today from the local ham store and I also purchased a lido lm-300 seat bolt mount as that seems like it will be the best setup in my car (a 2012 suzuki sx4).

After un-boxing everything and checking, the two attachments for the lido lm-300 don't match the faceplate or the front half of the radio that can be taken off.

I am considering ordering the front panel bracket (qmb-03) from http://importcommunications.com/.

But that looks to be a dash type mount. Can I use that bracket with my seat bolt mount lido lm-300?

Thanks for any help you guys can provide. I'm looking to get it mounted without hacking up my dash and remote mounting the faceplate on a seat bolt mount seems like a good solution.

The QMB-3 is pretty flexible installation-wise. And your control head will snap right in it as it mimics the plastic escutcheon bolted to the radio body, you just get the extra mounting
bracket. You can actually remove the escutcheon on the radio and make up you own mounting hardware. Removal requires removing the 4 Torx bolts holding it on the radio.
I can't say yes or no the QMB-3 will work right out of the box but usually some modifications
are needed. Myself, give me a vise, a hammer, drill and bits, hacksaw and some steel stock and I can make brackets that will fit anything.

I took your advice and created a adapter from mdf board that fit between the faceplate and the mounting bracket. But it turned out the goose neck wasn't really long enough for optimal placement. I ended up getting some velcro tape and set it in place in the console hole where I normally put my sunglasses and it fits great.

From: kd0rsw
Topic: 1349 Message: 1349

I am trying to figure out the hyper channels. The manual is not very clear on it.

As far as I can tell, the hyper channels are a way to store settings like offset, ctcss, etc for channel defaults to be used when manually programming new channels in. Is that correct?

Any info is greatly appreciated.

Thanks,

Derek

Milton ... Thank you, that helps a lot.
Now I'm not sure what a sub channel is?
Is it the mating frequency of a repeater off set or is it the frequency on the other side. (left side and right side). These are kind of foreign words to me .
Don .
ps Ed updated my radio and now it works like a champ, Every body remarks about the audio quality,
Now, I've just got to learn how to run it...
Going to demo it at the radio club meeting next week.

I'm so glad you got your radio updated and yes
it does fix 99.999999% of the issues.

Consider the Main and Sub bands to contain
the main and sub channels :)

Main band is either side A or B (A left B right)
with the MAIN icon attached on the display while
in the channels mode. So a Main channel could
be either side, press the channel encoder in momentarily
to select or the A/B switch on the mic. You will only
transmit on the Main band.

Milt.

I have a shack I'm building for a hackerspace, and the shack is in the center of a post-war warehouse. 18" thick reinforced concrete. 150' runs to the front and back where I can mount antennas. I've already got some long coax runs for HF, but looking for some creative solutions.

The AT-588 intrigues me. How long of a CAT5 run can I put between the radio and the head? Also, I see the external speaker port is on the radio body, but is there a speaker in the head unit also? If it would work, I could mount the radio closer to one of the walls in a junction box, and have the control head back in the shack.

Interesting radio either way. I'm also in the market for a mobile rig for my truck.

The 5888UV has a speaker microphone so that cures one
of your issues unless you want more volume. As far as the
distance of cable between the remote head and radio body goes
I've had it up to 25 feet. There is no known or published data
that takes you further. Only thing I can suggest is to push
the envelope and see what you can come up with. I don't have
cable longer than 25 foot to test with but maybe someone might
happen along here and give it a try with a longer length.

1356. Ctcss coded squelch bypassing

Yahoo group: Anytone_AT-588UV
Date: 2013-03-23 14:36:35 UTC
From: Al Chovanetz
Topic: 1356 Message: 1356

Has anyone found a fix for the coded squelch on the sub-band side openning whenever A signal with a different code than what is programmed is present on the subband side and the main side is in scan mode?

Sent from my iPhone

1357. 2 Tone/5 Tone

Yahoo group: Anytone_AT-588UV
Date: 2013-03-23 16:43:51 UTC
From: Myron Oestreich
Topic: 1357 Message: 1357

I am curious. I have read that the radio has the 2tone/5tone signaling, select call and things like that. What I'm wondering is if the radio will page similar to our public safety counterparts. With my line of work, I'd like to be able to ise the radio for work and play. Can anyone shed some light on this for me?

Myron, kb9stb

You would have to send the radio back to the seller
and hopefully they can have the radio's firmware updated.

The AT5888UV is a LMR or Land Mobile Radio so yes the signaling
should be compatible. Can't tell you how to do it but there are fairly
understandable instructions on how to set channels up to do both 2 and 5.
Some experimenting would be needed to figure out what tone groups
you would use.

1360. Making Settings Permanent

Yahoo group: Anytone_AT-588UV
Date: 2013-03-29 17:39:45 UTC
From: michael.kemmett@att.net
Topic: 1360 Message: 1360

I've entered about 60 freqs into memory, along with CTCSS codes, but the CTCSS codes are not being saved premanently.

After doing all that entry, I could not get out on TX.
It was then I noticed that the Freqs were in memory, but all other setting disappeared.

I followed manuals instructions for setting CTCSS codes, but they dissapear once I change memory channels.

I even made sure Hyper was set to Auto.

Any ideas ??

Thanks.

You DO NOT want Hyper set to Auto. Manual page 24 shows that the latest channel setup is stored- as a result every channel becomes the 'latest' and is stored. That is probably your problem.

Thank you for the quick replies.

I managed to get the frequncies (along with requisite codes) programmed into the radio after doing a factory reset.

For some reason (and don't ask cause I don't konw), I decided to try entering the codes before saving the frequency to the channel. When I programmed the CTCSS code at that time, that code became the default code for the radio, but it also stayed in the memory when I saved the frequency.

Luckily most of the reapeaters I needed to enter use the same codes, so changing them was not a big ordeal.

So far it seems to be working great, even after power down the memories have stayed.

Now I just have to get the programming cable, upgrade to the latest firmware, and be able to enter settings via computer. Although doing them manually really isn't so bad, just wa-a-y too time consuming.

Thanks again for the quick replies, I appreciate that alot.

The base of the control head is approx 5 3/8 x 1 1/2 inches. It tapers down in size as it goes out towards the knobs and stuff.

1367. Feature comparison Anytone AT-588UV & Wouxon KG-UV920P?

Yahoo group: Anytone_AT-588UV
Date: 2013-04-01 01:44:47 UTC
From: qrv@kd4e.com
Topic: 1367 Message: 1367

I apologize if this has been asked and answered - I did not find a link if it's out there.

Is there a feature comparison: Anytone AT-588UV & Wouxon KG-UV920P?

I am especially interested in a robust crossband repeat feature.

Thanks!

David

Use my 5888UV as a cross band repeater frequently.
to get into a repeater my hand held doesn't reach well.
If I didn't tell others I was using a cross band setup they
wouldn't know the difference. I don't know anyone who
owns the Wouxun, there may be one or two importers
who do. I think I saw a while back one importer / reseller
who posts in her infrequently say he had a Wouxun. Not
sure if this was the newer model or not. But the original
had bad problems with imaging or IMD or ACR. The 5888
isn't without its faults but the latest batches seem to have
tamed down a lot with few anomalies, some that I also see
in Yaesu rigs.

You don't have a choice do you? Other than purchasing
the bare mic. And why would you want just a bare mic?
I suppose as a ham I could get by without DTMF buttons.
I don't use them for anything. I do however use the customizable
ABCD buttons. For things like temporarily disabling duplex.
Friend of mine who owns a repeter, we occasionally talk on
his input simplex. I have another button set to change TX power.
Another to reverse the duplex. Good for shortcuts. But for DTMF
well since the cell phone I don't use autopatch. And I don't have
a need to send control codes not being a repeater owner or trustee.
I sometimes sub for net control during Skywarn or just the weekly
club net. But the repeater gets toned by someone else. I suppose
the owner would give me that ability if I asked, I've done work on
the repeater, and have been a club member for 22 years. But anyway
back to the topic. I suppose the plain Jane mic is probably slimmer.
That's my only beef with the DTMF mic. It's a bit more chunky than
say the Yaesu DTMF mic. But it is sure a purty thang. All them red and
green and blue and white lights makes it look important.

The transmit audio has been fixed and a couple firmware updates
are available but you have to send the radio back to your seller.

Obviously the reviewer has a very old prototype. No speaker mic
(if those pictures are of his radio) the function button text of the post
prototype models are white, not colored. So this review is invalid.

Another seller offers the radio shipped with either the DTMF or plain Jane?
I suppose some Japanese radios came with a plain Jane
and the DTMF was optional. My Alinco DX-SR8/T
HF rig came with a plain Jane mic. But how often do
you need DTMF on HF? But I do think they make a DTMF
mic for it. Maybe for on 10 meter FM? Don't know I don't
use 10 FM much other than to talk simplex on occasion to
a friend who doesn't care for VHF or UHF.

I see that the Anytone AT-5888UV is $300. shipped versus
the Kenwood TM-V71 which is $379.

The Kenwood includes CW-ID when in Crossband repeat mode,
does the Anytone?

Other feature comparisons, please?

i think some people are going to be using this radio for public safety
like me and my fire support unit now i am getting the full keypad mic
for my personal use rig but the one in the response unit will have a
plain mic so that when grabbing the mic you don't accidently hit some button

I could find any reference to a cw-id in cross band repeat for the Anytime but did for the Kenwood. Other than that, cross band repeat, & price I didn't see anything that jumped-out as vital to my choice. I was hoping someone had compared them & discovered something significant I missed. But I will look again tomorrow. Tnx.

1379. Re: [Anytone_AT-588UV] Why would one want the no-keypad mic?

Yahoo group: Anytone_AT-588UV
Date: 2013-04-01 05:04:21 UTC
From: Milton Hywatt
Topic: 1367 Message: 1379

And that is basically the way it is in LMR commercial
or public service. Limited function to the user to insure
that the user will not accidentally change radio functions
and settings while using the radio. A lot of said type of
users know virtually nothing about radio gear. And you
have purchased a LMR in the AT-5888UV, not a ham radio.
So it would be a definite advantage of the company who owns
your AT588UV to keep you from as many field addressable
functions other than what is essential.

1380. Re: [Anytone_AT-588UV] Anytone AT-5888UV vs Kenwood TM-V71A?

Yahoo group: Anytone_AT-588UV
Date: 2013-04-01 05:09:39 UTC
From: Colin McDonald
Topic: 1375 Message: 1380

at the risk of making milt pull an angry face on me, I'll say the tm v71 has options like the vgs1 voice readout module along with the message and audio recorder. It also has audio in/out jacks for echolink purposes, or for IRLP or whatever random use you can think to put them to.
It also has more memory locations I believe.
Along with that, I think it has the kenwood sky command stuff built in as well, but don't quote me on that.
I would check, but I think the TM V71 might have slightly higher power output on UHF, but again, check yourself...I may be thinking of an older version of that radio that had lower UHF power output.
At the end of the day, most of the features are very similar in function. Both radios have essentially the same features and functions. except of course the one, the 5888 is set up for a more commercial style situation, and the v71 is all amateur radio from the get go.

The v71 also has wide band receive up to 1GHZ if not higher.
Which is essentially useless unless you have analogue/conventional non-trunked agencies to listen to...and those are very far and few between these days. There ain't much above 520MHZ that isn't trunked, or digital, or both.
If you want a standard dual band, with cross band repeat and all the features that a typical dual band ham rig comes with, then the 5888 uv has all of it and a bit more.
The other radio is what it is and you will get some other features or functions that are more in line with a typical dual band ham radio I guess.
If you don't need a recorder, voice readout or the extra in/out audio jacks, then the 5888 is definitely the better deal.
And unless you live on the east coast or north eastern US where you have to plug in 1000 memory locations, the difference in memory capacity won't matter much either.
Just my two cents.
I am not going to recommend buying a kenwood on this list. In fact, I would actually recommend picking up the 5888 and see how you like it.

There we go, an honest opinion.

Regards
Colin

I see that the Anytone AT-5888UV is $300. shipped versus
the Kenwood TM-V71 which is $379.

The Kenwood includes CW-ID when in Crossband repeat mode,
does the Anytone?

Other feature comparisons, please?

Thats ok but let me advise you this forum's intent is not to
compare the AT5888UV to other radios. I'd allow some light
chatter about comparisons when the group traffic is down but
won't allow full blown out wars about this radio has that feature
that this one does not. If you've read the groups for the almost 7
months it's been around you've developed a sense for what the
AT5888UV has to offer. And if you own an AT5888UV what
is the difference? You have what you have unless you want to
sell it and buy something else. Not trying to be a prick, just trying
to be fair and support the AT5888UV and those who own it and
subscribe to this list.

The AT5888UV is a LMR. It's not an amateur radio so
don't expect it to have all those amateur toys. If you would
rather have a radio with WIRES, IRLP, DSTAR etc.. then
you should probably sell your Anytone and buy any of the
fine radios from Icom, Kenwood, or Yaesu that support all
that stuff. And don't worry about me being angry, I'm not that
kind of person and this group wouldn't enjoy the success it has
if I were.

I have a 588 in service as a Part 90 XBand repeater and it works just fine. It does not provide CW ID. I did some testing on a friend's 920 and the XBand repeat did work OK- no ID also.

A little off topic...you said that you occasionally talk on his input simplex. Did you mean output when duplex is disabled? I have talked on repeater outputs when the repeater is off or down but talking on the input still brings up the repeater if it is on. We practice talking on the output as standard fall back for ARES. Just want to make sure no one is confused by what shutting off duplex will do.

I agree with Milton. Buy a radio with all the amateur toys you want.

I own 3 TM-V71A's, they are great radios. I'm considering an Anytone because of it's Part 90 certification. Need to do more research before making a decision.

Different radios for different purposes, but both will serve most amateur use just fine. The V71 has it's pluses, but they may or may not be worth the extra $80 or more to some people. Only the individual can make that decision.

1388. Part 90 Question

Yahoo group: Anytone_AT-588UV
Date: 2013-04-01 23:29:04 UTC
From: n7kuw
Topic: 1388 Message: 1388

I'm considering an Anytone 5888UV as a Part 90 radio. What I have not been able to determine looking at either the manual or the programming software, is whether or not the radio can really be locked down completely per Part 90 requirements? Can it be programmed such that the user has no ability to program or change transmitting parameters (frequency, bandwidth, power, etc.)? Thanks for any information anyone can provide.

1389. Re: [Anytone_AT-588UV] Part 90 Question

Date: 2013-04-01 23:42:00 UTC
From: Milton Hywatt
Topic: 1388 Message: 1389

No the AT5888UV has several ways to temporarily modify
the operating parameters. This supposedly was made so to
keep interest in amateur radio operator.

Biggest difference is the part 90 Mandates. Does the TM-V71A do 12.5 narrow band channel spacing? Does it do channels steps in 2.5khz? If no then it's not legal to operate out of the US amateur band plan.

Oh, I fully understand that. I own about 125 Part 90 radios. The V71A is only used for amateur purposes, and my comments comparing it to the Anytone was meant only with regard to amateur operations. Sorry if I wasn't clear on that.

From: n7kuw
Topic: 1388 Message: 1392

Sorry to hear that, but thanks for the information. Agreed, it is marketed to two different groups/purposes. But to actually be Part 90 compliant (not just certificated), when placed into that type of service there can be no operator programming capability. The sticker by itself does not make it legal. There just needs to be a way so that for amateur use, you open it up and limit the VFO's to the ham bands, and for Part 90 use you lock it down. I honestly do not understand how any of the Chinese radios actually got Part 90 certification without being compliant in that regard.

I don't know exactly how certification occurs but I do know with the AT5888UV this is what the owner has to deal with. My guess the only way they could get any US certification was to go Part 90 and find some loopholes. Same deal with all the Chinese hand held radios. I would love to have someone chime in and explain it in simple terms how it's done.

Sorry to hear that, but thanks for the information. Agreed, it is marketed to two different groups/purposes. But to actually be Part 90 compliant (not just certificated), when placed into that type of service there can be no operator programming capability. The sticker by itself does not make it legal. There just needs to be a way so that for amateur use, you open it up and limit the VFO's to the ham bands, and for Part 90 use you lock it down. I honestly do not understand how any of the Chinese radios actually got Part 90 certification without being compliant in that regard.

and there in lies the loop hole in the language perhaps. Part 90 certified is not part 90 compliant maybe?
There has to be something that makes the 5888UV compliant, otherwise the reputable retailers that are selling it in the US wouldn't make that claim.
Making that claim goes beyond the right of an advertiser or a way of marketing the product.
Import communications says all radios are FCC type 90 certified. So they have the sticker, and presumably, that also means they meet type 90 compliance...
I know we're straying close to the kind of conversation that is beyond the scope of this list with regard to various laws and regs.
But I think it's a fairly important issue to clarify for any user of the 5888.
It's definitely certified for commercial use, and there must be enough criteria that meet type 90 compliance to allow retailers to make that claim.
Sales in the US are significant on both this radio, or will be, and on other HT's and mobiles of this kind. So if they weren't compliant, I'm quite sure we would be hearing about it from legitimate government sources rather than the odd guy who gets a bee in his bonnet.
:)

I'll leave it at that.

regards
Colin VA6BKX

There is one hand held radio the Baofeng UV5r/F-11 that in software
you can disable the Menu function. That would keep a user from changing
any set menu parameters. Wouxun makes a hand held with no keypad.
The radio is not field programable. These kinds of radios are what you
need to seek if you want to prevent accidental or purposeful modifications
from users in the field.

To get certification, the manufacturer must send the radio to an FCC approved lab who does all the tests. The manufacturer and the lab provide letters and documentation that certifies the radio meets the requirements. From what I've seen of the certification documents, the radios meet frequency stability, spectral purity, etc. - all of those critria. I have not seen anything, in any of the cert documents, that says the radio meets all Part 90 criteria. Regardless, the FCC has issued the certification.

Part 90 is very specific about not permitting user programming. It is the license holders responsibility to be compliant. So if you use a radio under your Part 90 license that is not compliant, then it is your responsibility.

I choose not to use non-compliant radios. I'm only responsible for operations under my (and my organizations) licenses. What anyone else chooses to do is not my business.

Date: 2013-04-02 01:19:01 UTC
From: n7kuw
Topic: 1388 Message: 1399

It is the license holders responsibility. Before anyone places a radio in service on a Part 90 licensed frequency (business or public safety), they should obtain permission from the license holder. If the licensee says it is okay, you as an individual have met your responsibility. If they say no, then you need to ask them what their recommended solution is.

There are a variety of reasons for this, Part 90 certification and compliance is only one of those reasons. Part 90 licenses specify how many radios can be operated under that license, and the licensee is responsible for managing that aspect also. They may tell you no simply because they are already at their limit. It may have nothing to do with the particular radio you wish to use.

I found the information I was seeking, and appreciate the answers provided. I agree, with that question answered it is probably best to close this topic. Thanks.

Unfortunately the Menu function is only disabled in MR/Channel Mode. Once you switch to VFO/Frequency Mode, (I don't know of any way to prevent switching to VFO mode) the Menus are available regardless of the software setting.

I notice a setting labeled "Setup Lock" in the Function Setup Menu of the programming software- I have not had a chance to play with this setting but suspect it should prevent changes to the setup from the radio. Has anybody tried this?

Also on the Baofeng you can set the VFO to function in channel mode and restrict it's frequency range to prevent changes.

Running Version 1.0.0 QPS588UV for QX-588 model. Software works fine and the "Setup Lock" box is on the Function Setup page in a box to the lower right of that page. Windows 7 system.

Very strange- Same version QPS588UV 1.0.0 but no 'Setup Lock' on Function Setup page. Win XP.

Same here. There is a box labelled "Prohibit the initialization", below which there is a "Beep" and an "Eliminate Squelch Tail" box. Could it be the "Prohibit the initialization" box was renamed (and the software version not changed)?

Someone else has told me they have a radio (that someone other than he programmed), and that it is in fact locked so he can't get into VFO mode. It sounds like there is in fact an effective way to properly lock the radio. I don't have one to play with, just the software without radio. Maybe that function box appears when you read a radio? This specific capability will determine whether or not I purchase one of these (and I would like to get one).

1406. Anyone know what this lone, solitary adjustment does?

Yahoo group: Anytone_AT-588UV
Date: 2013-04-02 23:03:49 UTC
From: Stuart
Topic: 1406 Message: 1406

Just about in the center of the main board, an inch from one of the (apparently) uP chips, is a teensy trim pot. Its function is a mystery to me. Whilst I'm usually the proverbial inveterate tinkerer, I'm reluctant to blindly vary what *could* be, just for ideas:

1) Max RF output;
2) Max dev;
3) voltage to varactor that affects the reference oscillator freq;
4) VCO loop filter
5) DTMF dev;
6) DCS waveform shape/symmetry;
7) CTCSS/DCS dev.....

Lotsa parameters, and still only one visible adjustment point.

Any ideas here from amongst The Better Brains® who hang out here?

I'm smart enough to resist the "siren call" of an adjustment point, but still curious enough to wonder just what it does.

Mark it with a tiny felt tip and then wiggle it and see if it affects tx/rx/whatever.

Looking in my English.ini file I did find an entry "1733=Setup Lock", but it does not display in my program.
I just mailed my 588UV back to Ed for a firmware upgrade. Maybe that will change the way the radio is seen by the software?? Maybe there is a different version 1.0.0 running around. I got mine from the importcomm web site. Of course there is always magic.

Step is how far the frequency moves per tuning click in VFO mode. The kHz numbers are actually Tx deviation and Rx bandwidth. The step size is not involved in channel mode or in programming channels.

Thanks John.

From what I get out of what you said, then in the VFO mode you can not really use that part for most of the repeaters in the upper part 2 meter US ham band as they would need either 5 or 15 Khz steps.

If that is so, then I guess that you have to program them in by computer, or maybe by the microphone pad ?

I guess that I will need to play with it a while on the bench with my service monotor to see what several functions do before I put it in my car.

I have been a ham for about 40 years, and radio is just a hobby. I have converted some comercial rigs to the ham bands, and find that the terminology used is often differant than what I would think. Then there is the conversion from one language to the other that often leaves much to be desired.

I'lll have a look later and see if I can find it in mine. There is only one version of the QPS software that works on radios off the production line. There is an earlier version for prototype radios but if you try to use it on the radios numbered 0001 or later it says wrong radio type. There might be something in the latest build of Chirp, I haven't don't anything with my 588UV radios for awhile but I have to go into the newer radio and rearrange some frequencies, put some into hyper channels but since it's a base station radio I don't really need quick access to much.

Or SO239. Unless you had a silver plated teflon insulated
PL259/SO239 combo they were rarely used in commercial
applications. The "N" connector is preferred for ultra high
and microwave frequencies. My General Dynamics R8000
uses the N connector for input into the device. But the PL/SO
connecters are cheaper and the 259 a whole lot easier to solder
onto 9913. My AR270B dual band VHF/UHF antenna terminated
into an N connection. First one of those I ever did back in 1993.
Needed to break out the big Weller gun. But the damn thing has lasted
out in the weather for 20 years. And it's up atop the roof on two
10 foot sections of Radioshack mast pipe which really sways too and fro.
Now my HF vertical which went up in 92 has a 239/259 connection
and it's as good as the day it went up on RG8/U. No real motion at the
connection though.

My step response was not clear. The radio supports a number of steps including 5 and 15. Whatever step size is selected via the Set (Menu) 3 is the VFO frequency change per tuning click. The step setting is ignored in channel mode.

What type of connector does the radio have for the antenna? I don't see anything about it in the manual.

yeh any proper commercial test gear I've ever seen has either N or BNC style connecters.
Anything to do with repeaters and duplexers are always N type as well.
Most ham antennas now also give the option for an N connecter.

Or SO239. Unless you had a silver plated teflon insulated
PL259/SO239 combo they were rarely used in commercial
applications. The "N" connector is preferred for ultra high
and microwave frequencies. My General Dynamics R8000
uses the N connector for input into the device. But the PL/SO
connecters are cheaper and the 259 a whole lot easier to solder
onto 9913. My AR270B dual band VHF/UHF antenna terminated
into an N connection. First one of those I ever did back in 1993.
Needed to break out the big Weller gun. But the damn thing has lasted
out in the weather for 20 years. And it's up atop the roof on two
10 foot sections of Radioshack mast pipe which really sways too and fro.
Now my HF vertical which went up in 92 has a 239/259 connection
and it's as good as the day it went up on RG8/U. No real motion at the
connection though.

Note that the 588UV has ONE antenna connector so a dual band antenna is the easiest to use. Separate VHF and UHF antennas will require use of a duplexer in reverse.

1426. Re: LCD Backlight Color

Yahoo group: Anytone_AT-588UV
Date: 2013-04-04 17:37:30 UTC
From: ronstartzel
Topic: 1112 Message: 1426

Jay, if you use the software to program the radio, you can make the display any color you want. Under the "Function Setup" menu, there is a block to click called "Backcolor Select" and when you click on it, it gives you 24 standard colors to choose from. If you don't like any of those, you can click the "Define Cusom Colors" button and pick from anywhere on the color graph.

As long as you click the "Ok" to close the color menu and the Function Setup menu it will be saved. After your write it to the radio, the display will be that color. You can have any shade of the rainbow you like.

Hope this helps and 73,

Ron

Basic programming of the radio it does pretty well.
So if you are interested in that, it will serve you well.
Be advised that reading and writing to the radio is slower
than the QPS software. Don't know if they fixed that yet.
What I like about Chirp is you can query an external data
source on the internet for free. Repeaterbook. And then
import a couple, most, or all the frequencies that the 5888UV
will handle. You pick a state, county, and band and it will download
it into a template, then you download from your radio and cut
and past the frequencies you want from the query into your radio's
template, make sure everything is correct then upload the template
to your radio. I think it also handles some other software exports
and CSV imports.

Yeah Ed's return address is on the USPS shipping label.
But I would email him first just to make sure. We had some
email QSO last night and I forgot to ask. He's got a pretty
cool QRP HF rig for sale now and has a company making
a custom HT for him with his name in Chinese "Shi Ying".

I'm going to shoot an email off to him right now. It doesn't
take as long for him to get back to me and not because
he doesn't care about his customers, it's because he
gets hundreds of emails every day and he relies on me
to be a liaison for traffic like this. I'll post a message when
I get a reply

The Chinese seem to prefer to reference the VFO steps
as PLL steps. I don't know which I prefer but if the
588UV user is reading their manual that's what they are
going to find.

My step response was not clear. The radio supports a number of steps including 5 and 15. Whatever step size is selected via the Set (Menu) 3 is the VFO frequency change per tuning click. The step setting is ignored in channel mode.

Ron- It sounds like you have different software than mine. My QPS588UV_1.0.0 software has Red, Green, and Blue settings in Function Setup with 32 levels for each color. There is no 'Backcolor Select in my software. What version do you have and where did you get it?

Since the LCD color is a global menu setting Ron can go into the radio's set menu, turn to items 45, 46, 47 and adjust the backlighting to his suiting. Then read the radio into the software and use that as his working template. I don't know of any other version of QPS other than what's on Ed's site or at Anytone's site http://www.qxdz.cn. Or Chirp 3.xxx

Thanks, but I gave up on this after reading this:

""The primary difference between the two types of FM is the number of sidebands in the modulated signal. Wideband FM has a large number (theoretically infinite) number of sidebands. Narrowband FM has only a single pair of significant sidebands""

Also what he is calling wideband is for the FM broadcast and not the more common 15 khz used by hams or comercial radio.

All FM has an infinite number of sidebands in theory. I am well awear of the math functions for FM which the author of this does not seem to be.

Now if the term Anytone is using is for the IF bandwidth or filtering, I can understand that beter.

I do have a very good service monitor, so guess that I will have to play with it for a while just to see what is going on with the terms Anytone uses.

1436. dual receive question

Yahoo group: Anytone_AT-588UV
Date: 2013-04-05 06:11:58 UTC
From: chris smith
Topic: 1436 Message: 1436

ok this maybe a dumb question well 2 questions i just got my radio and i was wondering if the radio will receive vhf/vhf at the same time like my FD channel 1 154.1900 and channel 3 155.14500 if so do i need to use a 2nd speaker or something because every time i run it in dual mode the sub band is muted even when i turn off muting.

the 2nd question is is there some way to increase the scanning speed.

thanks
chris

I set 'Deputy Channel Mute' to TX in Function Setup page. That only mutes deputy channel during Main channel TX. The radio wil handle VV, VU, UV, UU.
Scanning is fixed- Pick a larger step size or only scan memory channels.

You can also scan only those memory channels that you set as priority channels. See instruction book on how to set any channel or channels as priority, then there is another setting where you set the scan type as (MEM) to scan only memory chls or (MTM) scan just those chls that you set as priority. I assigned my -B- key on mic to toggle any Chl as priority on or off. And the mic -A- key as scan.

Ron,
You say that we can "Define Cusom Colors" button and pick from anywhere on
the color graph.
I have the 1.0.0 which is said to be the only version and I cannot find the
Custom Color Button.
I presume it is near the Color drop down box? Any help Ron and all.

The radio is capable of true dual receive, not just dual watch.
UU/UV/VU/VV through one external speaker. Oddly some radios
the middle jack was the proper external jack for both U and V.
Some the bottom jack. So try either and the radio doesn't
have to be set for any mode to get both out to the same external.

And no there is no way to increase the scan speed.
If you skip some of the channels you will lessen the channels the radio
has to scan through thus making the round trip back to the beginning
occur quicker.

I called here on Monday morning and had one in my hands on Wed afternoon.

http://www.associatedradio.com/home.php

They listed them in stock on the internet, but I called to make sure they actually did have one. It came with the programming cable , seperation cord, radio mounting bracket and the touch tone mic. It did not come with the program disc or a mounting bracket for the removable head.. $ 299 shipping included.

They emailed me a tracking number for UPS.

This is my only expierance with them, but it went as smooth as any I have ever dealt with.

1447. Deviation, Bandwidth & Frequency Step

Yahoo group: Anytone_AT-588UV
Date: 2013-04-06 02:10:02 UTC
From: kingfish_stevens
Topic: 1447 Message: 1447

Bandwidth, Tuning Step and Deviation are three different things.

Deviation is the amount of modulation (voice) carried on a frequency within its assigned bandwidth. This is never an adjustment you can make to a transmitter from normal user controls. In the older days, it was done by turning a pot on a circuit board. These days, it's often done with alignment software but never with consumer programming software. The amount of deviation depends on the level of the audio input. Look at the definition of Carson's Rule. Deviation for Wide-band FM is 3-5 kHz. Deviation for Narrow-band FM is 1.5-2.5 kHz (half the deviation of wide band). A wide-band signal takes up about 20 kHz of spectrum. A narrow-band signal takes up about 11 kHz of spectrum. And remember these are not setting choices on your radio, it's factory-set.

That brings us to Bandwidth. Every signal occupies space within the radio spectrum. It's best to only think of "channels" for this explanation. Each channel has a specific frequency, a "center frequency". Before Jan 1st, the "center frequency" for Land Mobile channels were spaced 25 kHz apart. If imaginary Channel 1 was centered on 460 MHz, then Channel 2 would be on 460.025 MHz. Two wide band FM signals could center on these two channels and their "width" would not interferer with each other. (Remember Carson's Rule, a wide-band signal is 20 kHz wide) There would be 5 kHz space between the adjacent edges of each signal. After Jan 1st, the FCC said that each channel would be cut in half. This would put the center of adjacent channels 12.5 kHz apart. So now we have Channels 1, 1-1/2, and 2. Center frequencies of 460, 460.0125 and 460.025 MHz. If the channels are 12.5 kHz apart and out signal is still 20 kHz wide, we will have interference between the channels. Thus, the FCC mandates the use of Narrow Band FM (NOT for Amateur Radio, only Land Mobile). Carson's rule says a narrow band FM signal is 11 kHz wide, so there is actually a buffer of 1.5 kHz between the edges of the adjacent signals.

So now that the spacing between channels has changed, how are we supposed to change channels? TUNING STEP! In the above example, let's say our radio was set to change 25 kHz with each click of the tuning knob. This means the radio is set for a "tuning step" of 25 kHz. (460.000, 460.025, 460.050) If we want to hit each of the new "in between" channels, we have to change our tuning step to 12.5 kHz. (460.000, 460.0125, 460.025) What if we set our tuning step to 5 kHz. Well we would tune 460.00, 460.005, 460.010, 460.015, oops we missed our channel. We would need to set our tuning step to either 6.25 or 12.5 kHz to land on channel 1-1/2.

Sidebar... To determine if a frequency can be tuned with a particular step, divide the frequency (MHz) by the Step (MHz). If the answer is a whole number, it will tune. If the answer has a decimal, that step will not tune the frequency. 154.6525 / .0025 = a whole number.

Sorry this was so long winded. Please don't nitpick this to death, I'm just trying to get across the difference between the three terms that others seem to be confusing and interchanging. If you can do a better job, have at it, I don't care to get into any debates on the subjects AT ALL.

Respectfully,
Ed Griffin

Jim

I am not at the house but will be back tomorrow and take some screen shots. After opening the software and getting into the function setup, yes I click on the colored box on the left side of the window/menu that opened. It is just a rectangular box that is colored. Once I click that box, I get the almost standard windows color selection menu: 24 standard colors to choose from and below that is the define custom color button.

I downloaded my software from Ed's Import communications site a few months ago. When I get back home from travel tomorrow I will verify the software version (probably exactly what Milton says) and relay that and screen captures o what I see.

I have been able to set my display to purple, light blue, dark blue, red, pink, yellow, green , orange, etc. I am NOT doing any of this from the ratio so can't help you with changing the color via that method. I spent about 15 minutes on Thursday evening writing different colors to the radio trying to get one that was both readable during a bright day and not overpowering at night. Looks like I will be settling in on a blue display for right now.

Im not sure if they have any in stock right now, but Lentini Communications in CT carries them. I know that they are expecting a shipment to arrive on April 11th so if they are out, they will have more soon. I highly recommend them as they have excellent customer service and are really good guys.
Here is a link to their website: http://www.lentinicomm.com/index.htm

It did not come with the program disc or a mounting bracket for the removable head.. $ 299 shipping included.

Thanks Ron, Is it possible this custom color block only appears when the software is hooked to the radio? My computer guy is going to work on my drivers this weekend and then I can explore.

Regards JIM

I recently came across this document that does a pretty reasonable job
of explaining bandwidth, deviation and channel spacing. It also mentions
guard spacing and how filters and frequency accuracy play into spacing. Some of the
explanations are pretty good, some are a little spotty. (Skip over the section
on pulse modulation the majority of the document is relevant to FM.

Overview of Bandwidth: Practicalities of Channel Spacing and Occupied Bandwidth,
http://www.rsgb.org/spectrumforum/pdfs/c5/c5_15.pdf

(It's from an IARU, Region 1 meeting in 2005)

Hope this helps,

Subject: [Anytone_AT-588UV] Deviation, Bandwidth & Frequency Step

Bandwidth, Tuning Step and Deviation are three different things.

Deviation is the amount of modulation (voice) carried on a frequency within its assigned bandwidth. This is never an adjustment you can make to a transmitter from normal user controls. In the older days, it was done by turning a pot on a circuit board. These days, it's often done with alignment software but never with consumer programming software. The amount of deviation depends on the level of the audio input. Look at the definition of Carson's Rule. Deviation for Wide-band FM is 3-5 kHz. Deviation for Narrow-band FM is 1.5-2.5 kHz (half the deviation of wide band). A wide-band signal takes up about 20 kHz of spectrum. A narrow-band signal takes up about 11 kHz of spectrum. And remember these are not setting choices on your radio, it's factory-set.

That brings us to Bandwidth. Every signal occupies space within the radio spectrum. It's best to only think of "channels" for this explanation. Each channel has a specific frequency, a "center frequency". Before Jan 1st, the "center frequency" for Land Mobile channels were spaced 25 kHz apart. If imaginary Channel 1 was centered on 460 MHz, then Channel 2 would be on 460.025 MHz. Two wide band FM signals could center on these two channels and their "width" would not interferer with each other. (Remember Carson's Rule, a wide-band signal is 20 kHz wide) There would be 5 kHz space between the adjacent edges of each signal. After Jan 1st, the FCC said that each channel would be cut in half. This would put the center of adjacent channels 12.5 kHz apart. So now we have Channels 1, 1-1/2, and 2. Center frequencies of 460, 460.0125 and 460.025 MHz. If the channels are 12.5 kHz apart and out signal is still 20 kHz wide, we will have interference
between the channels. Thus, the FCC mandates the use of Narrow Band FM (NOT for Amateur Radio, only Land Mobile). Carson's rule says a narrow band FM signal is 11 kHz wide, so there is actually a buffer of 1.5 kHz between the edges of the adjacent signals.

So now that the spacing between channels has changed, how are we supposed to change channels? TUNING STEP! In the above example, let's say our radio was set to change 25 kHz with each click of the tuning knob. This means the radio is set for a "tuning step" of 25 kHz. (460.000, 460.025, 460.050) If we want to hit each of the new "in between" channels, we have to change our tuning step to 12.5 kHz. (460.000, 460.0125, 460.025) What if we set our tuning step to 5 kHz. Well we would tune 460.00, 460.005, 460.010, 460.015, oops we missed our channel. We would need to set our tuning step to either 6.25 or 12.5 kHz to land on channel 1-1/2.

Sidebar... To determine if a frequency can be tuned with a particular step, divide the frequency (MHz) by the Step (MHz). If the answer is a whole number, it will tune. If the answer has a decimal, that step will not tune the frequency. 154.6525 / .0025 = a whole number.

Sorry this was so long winded. Please don't nitpick this to death, I'm just trying to get across the difference between the three terms that others seem to be confusing and interchanging. If you can do a better job, have at it, I don't care to get into any debates on the subjects AT ALL.

Respectfully,
Ed Griffin

Jim,

I just uploaded some pics of what I am seeing to the photos section.

I am able to select color options as soon as opening the software. Here is what I have and working with:

I have QPS588UV
Running Windows 7
I don't have anything connected to the computer

The first image is LCD1. It shows exactly what I see when I open the software and click on the "Function Setup" on the left.

LCD2 shows what happens when I click in the color area. The color selections box/menu opens up. Near the bottom of that menu is the "Define Custom Colors" button.

LCD3 is what shows up when I clide the "Define Custom Colors" button. You can click anywhere in the rainbow section on the right and then drag the black arrow to set the intenstity..."RGB" levels

LCD4 is a capture of doing what I typed above. If you like the color, you click the "Add to Custom Colors" button on that pop up window/menu and use it again in the future.

Hope these help.

Ron

Has anyone done any work with the scrambler function of this radio? looking at replacing some radios in our volunteer fire dept trucks and would love to use these as they are dual band and we have made mutual aid runs to neighbooring counties that are on vhf (we are uhf) but scrambler would be a must for our county

there are times that we will switch over to scramble to talk to the law enforcement officers if we find something strange or something they need to be aware of, to many scanners in the hands of people that dont need them around here have had some fires that were questionable in nature and dont want everyone to be able to hear the conversation

From: James
Topic: 1457 Message: 1457

Milton.

Can you give us the proper place to download the Anytone Software?
This is confusing as Ed's side appears NOT to have the Ver. we need.
You mentioned about combining a couple of files that were too big to import from Yahoo.
We find we cannot run the program to combine the two together.
We need the link that has both files.
Ed software is still Ver.1 When I compare mine to the screen shots posted yesterday there is a difference especially on the background colors. The screen shot shows several boxes not shown on the first download.

Thanks for your help Milton.

Regards Jim KA2AJH

so what are you doing that needs to be 'covered up'? all public service freqs should be wide open. we, the people do have the right to know what public service is doing at all times. (exceptions for police undercover operations).

Most likely it is a simple voice-inversion scrambler. As long as you use the same code it should work.

Most of the hams that use these aren't permitted to scramble voice on amateur frequencies. However if you have a commercial license it's probably ok. There are 9 selections between different scramble modes. I imagine that they are pretty universal among Chinese radios. So if you have a Wouxun or Baofeng HT with scramble mode 4 active, you would match that with the 5888UV. One thing it's going to be pretty easy to figure out which of the 9 modes your using by anyone with a radio that scramble. Just listen and turn the knob through
9 steps while the other parties are talking.

1465. Re: [Anytone_AT-588UV] Re: Anytone Software {Topic closed for now]

Yahoo group: Anytone_AT-588UV
Date: 2013-04-08 22:01:06 UTC
From: Milton Hywatt
Topic: 1457 Message: 1465

Says it's for the AT588N whatever that is. I can't find any software for the QX588UV.
at qxzd.ch.
There were two versions of the software as are two versions of the revive software.
The first version of the software would be called AT588UV.exe of something
like that. The second would be QPS5888UV.exe and that us what I use with my
radio with a production date of 1-7-2013. In the FUNCTION SET menu there
are 3 consecutive cells that say Back Color. Maybe 4 cells down from the top.
I'm thinking the prototype radios reported their model back to the software as
AT588UV because the current QPS5888UV reports the radio model as QX5888UV.

So logically AT588UV software for the prototypes and QPS5888UV for the
radios for those that were sold from the start of sales production. My #19
radio off the line works with QPS588UV. My #285 radio won't read with the
AT5888UV revive software says "wrong radio type" but reads ok with the
QPS5888UV revive software.

The newest software available I know is version 1.0.0, copyright 2012 - 2013.
Now if anyone can prove there is a newer version of the software, email it
to me. Until then I'm going to close this topic. Please no more replies

1468. REGARDING SENDING YOUR RADIO BACK FOR FIRMWARE FLASH

Yahoo group: Anytone_AT-588UV
Date: 2013-04-08 22:27:55 UTC
From: Milton Hywatt
Topic: 1468 Message: 1468

I may or may not have mentioned it but Ed is requiring that those sending their radios include some correspondence about the problems they are having and a return address. Also Ed will not pay to ship the radio back so you must include a payment of $15.00 US with the radio for return postage. Those of you that have not must mail Ed a money order for the radios you have sent him. If there is an alternative payment method available I'll ask him and reply to this message.

1469. Firmware Updates - Import Communications

Yahoo group: Anytone_AT-588UV
Date: 2013-04-08 23:18:30 UTC
From: kingfish_stevens
Topic: 1469 Message: 1469

Regarding firmware updates. There have been two firmware updates issued by the factory. The first update included replacing the mic jack/circuit board. This update fixed the problem of the first syllable of a transmission dropping out. All radios I sold that had this problem should have been fixed before shipping or were recalled and updated. The second update was to correct the sub-band CTCSS problem. Neither problem necessarily exists in every radio, so not every radio needs to be updated.

I have no magic list of serial numbers that tells one radio from another. If you are experiencing either of these problems, only then should the firmware be updated.

The factory asked that I return the borrowed firmware writer so I had to purchase one on my own to the tune of $200. And no, I won't tell you what, when, where or how to do it.

Radios purchased from Import Communications will be updated for free (others will cost $50). Plus you will be responsible for the return shipping costs. You can include a prepaid shipping label or $15 for insured Priority Mail. If you return a radio, pack it in as small of a box as possible, preferably not the factory's colored box. Send ONLY the radio, no mics, cables, brackets, etc. Include a legible return address, a note saying why it needs upgrading and the return postage.

Import Communications
PO Box 451
New London, NC 28127

Regards,
Ed Griffin

Does this apply to the people who purchased early models of this radio when the internal software was in error.. I have two radios, number 138 and 145 that have not yet been updated with the original software update and Ed has been saying all along that he will pay to reship those radios if we will pay to return them to him.
I am just getting my radios as I have been away from my home since January 1stl. and just got home to receive them.

What is up?

I am confused, the software I have says it is ver 1.01 and it does not show the colored box on the Set Function Screen like the photos you posted on this group site,

I checked Ed's page and the Manufactures site and the Manufacture's site has only the 'N' version, did I miss something there or are we waiting to figure out where Milton's software came from?

I also could not combine the two parts of the software from this Yahoo site and get it to run. Could Milt's software be different from what is on Ed's site and the manufacture labeled them both as the 1.01 version?

1475. Re: Part 90 Question

Yahoo group: Anytone_AT-588UV
Date: 2013-04-10 13:25:24 UTC
From: n7kuw
Topic: 1388 Message: 1475

To briefly re-visit this topic, A friend obtained one of these radios and has in fact determined how to program it so that it is locked in channel mode and not able to enter frequency mode from the front panel controls. This does in fact satisfy the Part 90 compliance.

In the programming software, under function setup, the first entry is Display Mode. When you set this to Channel, another drop down menu option appears which gives you a "lock" or "no lock" option. When the "lock" option is selected, you are not able to use the frequency/channel button to leave channel mode.

With display mode set to either frequency or name, the lock option menu is not available, which is why I think several of us were unable to find it in our software previously.

So when you lock the radio to channel mode you can't change
channels? I think what most were looking for was a way to lock
the radio from getting into the 'set' menu system.

Subject: [Anytone_AT-588UV] Re: Part 90 Question

To briefly re-visit this topic, A friend obtained one of these radios and has in fact determined how to program it so that it is locked in channel mode and not able to enter frequency mode from the front panel controls. This does in fact satisfy the Part 90 compliance.

In the programming software, under function setup, the first entry is Display Mode. When you set this to Channel, another drop down menu option appears which gives you a "lock" or "no lock" option. When the "lock" option is selected, you are not able to use the frequency/channel button to leave channel mode.

With display mode set to either frequency or name, the lock option menu is not available, which is why I think several of us were unable to find it in our software previously.

So it keeps the radio from entering a vfo mode
forcing the user to use only the channel mode
and that is not something that can be changed in
the 'set' menu. Even at that if the set menu can still
be accessed, some of the global settings could be
modified by an employee that didn't know what they
were doing could take the radio out of Part 90 compliance.
What's needed is a way to totally disable any field access
to anything but turning channels and powering on and off.

From: jwheatleyus
Topic: 1388 Message: 1479

I did a quick check on my 588UV this morning to verify the function of the "Lock" setting. It does disable the VFO selection. The 'Set' button still works, but changes to settings like Tx CTCSS appear to work, but they do not save- ie they can't be changed. I did not check every possible parameter, but it appears that the 'Lock' setting does prevent front panel changes to pertinent parameters.

I see so you can change thinks like wide narrow CTCSS but they don't stick
when you back out of 'set' ? I'd check it out myself but we're in the midst of
a powerful thunderstorm with dime size hail, heavy lightning and damaging
winds.
Sent from my 15.4" MacBook Pro i7 quad core OS X Mountain Lion

Subject: [Anytone_AT-588UV] Re: Part 90 Question

I did a quick check on my 588UV this morning to verify the function of the "Lock" setting.
It does disable the VFO selection. The 'Set' button still works, but changes to settings
like Tx CTCSS appear to work, but they do not save- ie they can't be changed. I did not
check every possible parameter, but it appears that the 'Lock' setting does prevent front
panel changes to pertinent parameters.

From: n7kuw
Topic: 1388 Message: 1481

I'm not sure being able to access some of those settings (such as CTCSS or DCS) would take you out of Part 90 compliance (although it could keep that radio from working properly in the system it is supposed to be part of). Even being able to change power is arguable as to whether or not it actually takes you out of Part 90 compliance, although that easily could take you out of license compliance, which is the whole purpose of having a Part 90 compliant radio.

I agree, Wouxun, Baofeng, Anytone, etc., should have a truly "locked down" setting, which would meet every requirement for use in a Part 90 environment. If I am purchasing for a licensee, these radios would not be in consideration even though they are very price competitive. For my personal use (including in Part 90 situations) I consider the Anytone acceptable (as long as it is programmed to be locked in the channel mode).

However if you can change narrow deviation to wide and take the radio out of Part 90 operation, that's not acceptable. I don't know how they get away with it but the only proper Part 90 radio is completely disabled for anything in the field except PTT and channels change.

Subject: [Anytone_AT-588UV] Re: Part 90 Question

I'm not sure being able to access some of those settings (such as CTCSS or DCS) would take you out of Part 90 compliance (although it could keep that radio from working properly in the system it is supposed to be part of). Even being able to change power is arguable as to whether or not it actually takes you out of Part 90 compliance, although that easily could take you out of license compliance, which is the whole purpose of having a Part 90 compliant radio.

I agree, Wouxun, Baofeng, Anytone, etc., should have a truly "locked down" setting, which would meet every requirement for use in a Part 90 environment. If I am purchasing for a licensee, these radios would not be in consideration even though they are very price competitive. For my personal use (including in Part 90 situations) I consider the Anytone acceptable (as long as it is programmed to be locked in the channel mode).

--- In Anytone_AT-588UV@yahoogroups.com, "jwheatleyus" <taoswheat@...> wrote:
>
> I did a quick check on my 588UV this morning to verify the function of the "Lock" setting. It does disable the VFO selection. The 'Set' button still works, but changes to settings like Tx CTCSS appear to work, but they do not save- ie they can't be changed. I did not check every possible parameter, but it appears that the 'Lock' setting does prevent front panel changes to pertinent parameters.

> > > > >
> > > > > Someone else has told me they have a radio (that someone other than he programmed), and that it is in fact locked so he can't get into VFO mode. It sounds like there is in fact an effective way to properly lock the radio. I don't have one to play with, just the software without radio. Maybe that function box appears when you read a radio? This specific capability will determine whether or not I purchase one of these (and I would like to get one).

1483. AT-588UV or Kenwood TM-V71 for remote base

Yahoo group: Anytone_AT-588UV
Date: 2013-04-12 01:41:36 UTC
From: iapx432
Topic: 1483 Message: 1483

Anyone have real first hand experience with both the V71 and 588UV in crossband, remote base applications?

I have a V71 now, and am thinking about picking up a second one for remote base uses. It's an excellent radio in this application - the U and V sides don't self-interfere, receive performance doesn't degrade even when the other side is transmitting at 50W, receive to transmit turnaround latency is small. However, the 588 is a few bucks less so I'm considering it as well.

Thanks,
Robert

I used my 5888U cross band last night to get into the
Skywarn repeater which I can't hit direct on my HT. Several
hours of emergency net control and the radio performed
flawlessly.

I've previously posted regarding issues when driving through Metro St Louis from cross-mod, intermod, what have you

Had things set at 5-9 on both sides.was experimenting the other day and found there was an "off" setting

I've even been able to put the 3 db vhf antenna back on the car with no issues

And I seem to be picking up mobile fire dept units now (non rpt freq)

I'm a very happy camper now

Oh yeah I though the RF squelch sucked poop through a tube
on these later dated units. Radios with no silk screen of AT5888UF
on top. Now, on the thirteenth radio to pop off the assembly line
you had to use it or side A and B would fight with each other.

Hello.

I am looking at purchasing the anytone. I can not find any documentation or site showing FCC part 90 aproved, except for dealers stating on their site. I will be using this radio for both amateur radio and also public service on our county repeaters and the public safety official won't authorize me to use this radio unless I show FCC proof of part 90. FCC documentation. so Im looking for a link with documentation.

You could email the manufacturer and have them email you
back that the radio is part 90 accepted.

I'm the list owner. And if you are so frail that the word
"poop" offends you, please unsubscribe immediately if not sooner.
And if you choose to stay, I won't tolerate personal attacks. I created
this group back in September 2012 and have doled out hundreds of
hours supporting this radio out of my love and passion for the hobby.
If you want bible school style discussion of the AT5888UV then go
create you own group and moderate it how you wish.

1497. Question

Date: 2013-04-17 23:55:40 UTC
From: Robert Korb, Jr.
Topic: 15 Message: 1497

So this might be a simple question but I haven't been able to figure it out yet.

I have recently installed the radio and loaded a profile into it with a mix of VHF / UHF. I want to be able to scan VHF on one side and UHF on the other. Is that possible? If so how do I set this up? Both sides currently have a mix of both and during scanning when selecting either the left or right or it mutes the opposite side. Is it possible to get the radio to not mute either side at all?

Sorry if I'm over thinking this. I guess I'm just used to my Kenwood D700 that I was hoping this would work similar.

Best,

Rob

Since VHF and UHF are co-mingled in the channel data, I don't think you can force V to one side and U to the other. You can control the mute however. Look at Function Setup, Deputy Channel Mute and set it OFF to hear both sides all the time.

1500. Question Please :-)

Yahoo group: Anytone_AT-588UV

From: w2eec
Topic: 1500 Message: 1500

Hey all.
There comes a time when your Yaesu FT-1802 decides to call it quits. He is old and gray and wants to retire to the great parts box in the closet! Now comes the time to look for replacement. A while back I was looking in to this unit when it was called 588UV and the only people that had one was testers. I have not seen much about the new 5888UV. Did a google search and didn't find much. I also looked at Youtube and only found two videos. I also did a search in the posts for "5888UV Vs. Yaesu FT-8800 and 8900" with no luck. What I am looking for is anyone that has experience with the Yaesu units and compair it to the AT-5888UV. I have used the Yaesu 7800, 1802, 817ND and 897D so I know how the programing is on them and the menus. How does the AT-5888UV compair? I also have a Mac so I cant use it to program the rig so how is it to hand program? I plan on getting two of whatever rig I decide on. One for a base at home and the other for my truck. If I get the AT-5888UV, has anyone tried to clone them with what looks like a CAT cable? I have seen that the TX and RX sound good and that is a positive and I like that Chirp now works with the 5888UV. The hand mic looks awesome! Does anyone know how the display looks in the sunlight and how the display holds up to the Northeast winter cold? To the people who already have one, how have yours held up and do you think that the AT-5888UV would hold up as good as the Yaesu rigs? I really like the dual receive feature and the home feature. I like the fact that I can listen to any repeater and then push the home button to join my local net that I use everyday and on the other receive be listening to my local FD. Speaking of scanning, how fast does the AT-5888UV scan frequencies? I know with my Baofeng UV-5R, it is slow and I hope the 5888UV is better. One more question about scanning. Can you disable transmit in the saved memories for the frequencies you just want to listen to? Thanks in advance to anyone that helps.

Thanks Todd.
This helped a lot. I really like the FM broadcast receive and aircraft band receive features. I almost forgot about them. I live very close to a large airport and from time to time I like to listen. I use to use my 897D but that needs repair work so this will fill that space nicely :-) I also like that the menus are close to the Yaesu menu system. Easy for me to get around. I also like how it is between $100 and $150 bucks less expensive. I think it is a done deal for me. Just have to see when the next shipment comes back in.
So Todd. How do you like yours and how long have you had it?
Thanks.

Being the owner of two 5888UV's and one FT8900 plus formerly an FT7900
I can tell you the 5888UV hang right in there performance-wise. And I can
find some glitches with both radios. With the 5888UV you get a lot of
bang for the buck. I don't believe the 5888UV has FM broadcast RX though.
At least neither of mine don't. Maybe that's a new addition? But the AM aircraft
band works better than the FT8900. Better I mean by signal comparison. One
thing I don't like on the 5888UV is the speaker. You tend to hear some hash
generated by the radio's internal clocking. It isn't loud but it annoys me. However
an external speaker will take care of that. Probably can pick one up at a truck stop
or radio shop. I think I bought both of mine at the Flying J or T/A. They filter
that stuff right out. The speaker mic is ok. Once in a while I'll get my 25 foot
jumper and remove the control head from the 5888UV and bring it out of the
radio room into my living room and operate from my recliner. Nice to have a
speaker right with you. I do the same with my Alinco DX-SR8/T HF rig. But
its speaker is in the control head. So there, hope to have given you some things
to think about.

Milton, list owner.

Thanks Milton.
As to the FM broadcast RX, I was reading a review wrong. Sorry and thanks for the correction. I dont know where you live but I would like to ask you sense you own and use the 5888UV if the area that you live in gets cold? How does the display hold up? I live in upstate NY and it gets cold! On my 1802 the display moves slow when it is cold and sometimes it looks like the display fogs up a bit. Any problem with yours?
I was just looking at the calendar and I think i'll place my order on the May 3ed (payday) if they are in stock. I am impressed with the info I have seen about them so far.
Hope hand programing them isn't bad. Looks like that is the way I am going to go because I dont have a Windows based computer. Just a Mac.
Thanks for the info.

There is no "new" update policy, I have always been willing to update radios that were sold by me. I don't ever recall stating that the return shipping would be free. The exception to this was for the first dozen or so that went out with defective mic jacks. Customers were to refuse delivery on those radios and after they found their way back, I repaired them and re-mailed them at my expense. The remaining stock from that first shipment was repaired and updated before they were shipped to customers. Your radios most likely fall into that category. The factory has never given me any series of serial numbers that are indicative of any known problems, so serial numbers don't alert me to anything.

The only problem that has been discovered since that first batch of radios has been the problem of CTCSS on the sub-band, that not all radios seem to have. The factory provided me a firmware fix for that problem.

Of the radios sold by me, ONLY radios that have a problem with CTCSS on the sub-band will benefit from this latest firmware update. I will provide this update to my customers free of charge except for the expense of return shipping, which is $15.00 for insured Priority Mail. Radios that were bought from other dealers can have the mic jack replaced and the firmware updated for $50 + the return shipping costs. And honestly, I would just as soon not mess with those anyway.

Regards,
Ed Griffin

I have one radio where half the display blanks out when it's below say 20F. That is a problem with the display as the second radio I bought is fine. I have a replacement LCD panel, just been too lazy to replace it. As far as programming the radio using Mac, there is a program called Chirp that runs on OSX Mountain lion and maybe Lion and before a couple builds. You just need to get a cable with a real Prolific 2303 HX/HTX chip inside and then install the driver package. I use it on this Intel MacBook Pro.

1511. Setting the AT-5888UV to Crossband mode

Yahoo group: Anytone_AT-588UV
Date: 2013-04-26 16:44:14 UTC
From: Wayne Guazzo
Topic: 1511 Message: 1511

I recently received an AT-5888UV and tried to set 146.000Mhz and 446.000 Mhz in crossband mode. I get to where the display shows "XSTART" but when I press the Main Band Selector knob I don't get the "DU" prompt or the"RPT" Display, that would indicate the Crossband Repeat mode is turned on.

At the top of the Crossband Repeat Section in the manual it talks about setting the Left and Right band to VHF and UHF and then turning the function off. I think this may be where I'm going wrong because I'm not sure what this is asking me to do. Can somebody tell me how to put the radio in Crossband Repeat mode.

Any help is appriciated.

Try as the best to program the AT-5888UV using your computer.

I am sure that you will resolve the problem!

When did you purchase the item? Do you have your radio firmware updated?

How I do it is select the input frequency UHF and output frequency VHF. Save those to channels. Or use the software to set it up. I run my radio in the name display mode so I called the UHF channel x-band-u and the other x-band-v. Since I'm using this to get into a repeater I can't hit from my HT I uses CTCSS encode and decode on the radio and HT. I make sure that x-band-u appears on the right and is the Main side and x-band-v appears on the left. Then press set and rotate the knob to x-rpt and press the main band knob once. Then xstart appears. Press the main band knob again and xstart disappears and in the middle you will see rpt. Press set to end cross band.

I'm doing it exactly as you describe. when the radio shows x start I press the knob and it just goes into regular mode, not Crossband repeat as the manual describes. Maybe its a bug in this radio.

Maybe a bug. If you use computer software and have a recent
image stored on your PC you may try to do a factory restore.
If you've stored your two frequencies on two channels, turn
to those channels with the output on the left side the input on the
right even if the main band is on the left side it will go into crossband
mode. And mine works real well in crossband. so try a restore.

I'm doing it exactly as you describe. when the radio shows x start I press the knob and it just goes into regular mode, not Crossband repeat as the manual describes. Maybe its a bug in this radio.

When entering XBand repeat, the only indication is a small RPT in the center of the display between the A and B Frequency displays. Do you see the RPT?

No, he is saying he does not. At least that's how I interpret "I'm doing it exactly as you describe. when the radio shows x start I press the knob and it just goes into regular mode" And I mentioned specifically the xstart will disappear and in the middle you will see 'rpt' . Hopefully it's just an issue that a restore would take care of.

normal is the basic memory channels that you program everything into
limit is for scan edges i believe as for hyper 1 and hyper 2 i am not
100% sure what those do

Hyper channels are quickly accessed programable channels. I think you get one per band of operation in each hyper mode. I don't use it but that's what the discussion here seems to point to. As far as normal and limit go, that could pertain to a lot of different things.

Hyper 1 and 2 are sort of handy for setting up 4 channels for quick access. To use them-
Select Hyper 1 in the software
Uncheck all boxes
Set Left and Right to Channel
Put a desired channel number in Left and a second in Right
Set Sub to Frequency
And Main to Left or Right depending on which channel you want to be Main
Return to Normal Channel Edit (always Write to radio from Normal Edit)
Write to radio
Now when you press Left Volume Knob, Hyper 1 Channels will be selected
Do the same for Hyper 2 but press Right Volume Knob for Hyper 2
Now you have quick access to 4 channels of interest.

Dear friends, hams and those who is going to like radio!

I work over 10 years in radio communication field dealing with different kind of users, most professional, other less, other with hard experience, other with no or less experience.
Unfortunatelly many buyers are not happy or are facing severe problems with an order, misunderstandings, wrong equipment. Especially if buying direct from China. Most chinese retailers has poor english or other poor understanding of what buyer express when wants to order something like two way radio, repeater or mobile phone with top notch technologies like 4G or dualband phones(CDMA+GSM).
I had personally often discussions with many chinese retailers who sell different stuff, as resulf: BAD ENGLISH, MISUNDERSTANDING. I am asking one thing, chinese retailer tells me something else.
I dont want to advertise myself as someone special, but some people asks me somethimes why some of my services or goods expensive. As professional with years of experience, I respect myself, my hard job. I don:t like cheap souk.
I am not a boaster, but if it comes to the the procurement of goods, I know perfectly well how to talk and negotiate with vendors' what to say to them and what not. If I ask a lot of questions to the buyer, let the accept it for granted.
If you want to order something from China through me, I guarantee that you will be very happy with me.

I give all people a cool tip: the avaricious pays twice.

So if you want to order a portable radio or repeater station or car ---- contact me! You will be very satisfied!

You'll find it easier to work with once you get it. The Chinese to English translation in the software and user manual is poor. Personally I prefer to use Chirp. You can import repeaters for your county listing in Repeaterbook. It is part of Chirp. If you need help once
you get the radio, contact me off list.

1528. Anytone AT-5888UV Shipment Update from Import Communications

Yahoo group: Anytone_AT-588UV
Date: 2013-04-28 16:52:31 UTC
From: Milton Hywatt
Topic: 1528 Message: 1528

Dear customer,

AT-5888UV radios have finally shipped from China. Anytone had scheduled this shipment on April 20th but delayed it until yesterday. A shipment of 100 radios should arrive May 1st or 2nd. Your order will be shipped as quickly as possible.

When we print the packing slip in preparation for shipping, you will receive a "shipped" notification via my shopping cart. This only means we are preparing to box it up.

When we actually print the USPS postage label, you should receive the tracking number from Stamps.com. The radio will go in the mail that day.

At this time, 30-40 have been pre-sold to customers. If any radios that remain in two weeks, will be taken to the Dayton Hamvention.

I apologize for the delay and appreciate your patience. It has been a trying experience for all of us dealing with this radio. Hopefully it will go smoother in the future.

The home channels are still not modifiable. And I doubt they ever will be.
Instead try using the Hyper Channel function. There are completely programable
and available with one or two pushes of the channel encoder knobs.

For those who might own the AT5888UV and a ham dual/multi band for instance like the Yaesu FT8900 and listen to both conventional public service on either U or V bands, you should notice an extreme increase of received audio on both U and V bands on the AT5888UV. I had been using the FT8900 mobile and while I'm out and about I set the sub band on a 460 mhz conventional local police frequency. The other day I noticed that I had the volume cranked to max on 460 and without the windows up could not copy any conversations easily. No problem, the power plug for both the FT8900 and AT5888UV are identical. So I swapped radios. I was immediately stunned by the AT5888UV's volume level on both U and V bands compared to the FT8900. And this was with the radio's built in speaker.

Just a little FYI for those interested parties. And the AT5888UV has Mighty receive volume everywhere even without an external speaker.

That is very good to know. My truck is loud. The AT5888UV keeps sounding better and better to me. One exception. I was just reading that the home button doesn't work. That was one feature that I really wanted to use for the traffic net I work. Hope it is a firmware fix down the road. Sooner and not later :-) Can't wait to place my order this payday. this month, one for my truck and next month, one for my house.

1535. Dual control heads

Yahoo group: Anytone_AT-588UV
Date: 2013-04-30 01:12:00 UTC
From: Garrett
Topic: 1535 Message: 1535

Does anyone know if it would be possible to install dual control heads on one of these radios? Maybe just using a cat5 splitter? This is a common setup on fire apparatus and is usually only an option with high end commercial radios. If this is possible, is there a source to buy just a control head?

I have not tried it, but I suspect the two heads would have to fight because there is no method for selecting active head. You could do it with a 8 pole 2 position switch. Might be easier to just buy two radios.

while I haven't heard the 5888UV in person yet, I can vouch for the exceedingly low audio output on the 8900.
Yaesu went for quality instead of quantity. The audio is very pleasant to listen to, but in a vehicle you can hardly hear it most of the time.
As we've discussed before, communications audio is narrow and should be pretty crisp to be easy to hear and understand.
You don't want hi-fi quality because 90 per cent of the information will be lost...at least in a mobile environment and on our typical conventional emphasised FM.
You want about 2K of actual audio bandwidth coming at you in order to overcome wind and road noise.

Subject: [Anytone_AT-588UV] Recent observation.

For those who might own the AT5888UV and a ham dual/multi band
for instance like the Yaesu FT8900 and listen to both conventional public
service on either U or V bands, you should notice an extreme increase
of received audio on both U and V bands on the AT5888UV. I had been
using the FT8900 mobile and while I'm out and about I set the sub band
on a 460 mhz conventional local police frequency. The other day I noticed
that I had the volume cranked to max on 460 and without the windows up
could not copy any conversations easily. No problem, the power plug for
both the FT8900 and AT5888UV are identical. So I swapped radios. I was
immediately stunned by the AT5888UV's volume level on both U and V
bands compared to the FT8900. And this was with the radio's built in speaker.

Just a little FYI for those interested parties. And the AT5888UV has Mighty
receive volume everywhere even without an external speaker.

Milton, list owner and lovin his Chinese radio gear.

On the higher end public safety radios, both heads are always active, the head just sends a signal to the radio to change whatever input you press, and the radio sends back display info. I don't know if the Anytone operates this way though.

I found that out when the LCD first started to appear on devices and reading how they work with the polarity of the layers of liquid crystal. On my newer 5888UV it's actually readable for the most with polarized sunglasses on. Except one blotch in the right corner. My Yaesu FT8900 is for the most part unreadable until you turn your head sideways.

I have two radios but I'm not going to try it. One half of the micro controller and firmware are in the control head, I couldn't predict what would happen if you presented the radio with serial data from two control heads.

Unfortunately the Chinese have a different view as to what a home channel is.
So it will likely stay as is. Now enter Hyper channels. If you have some programmed
they are available with a simple push quick of the channel encoder knob. Couldn't
get any easier. This is info I've gleaned from others here namely Mr. JWheatley. I have
not tried it myself but I intend to as soon as I get caught up on all my outside work.
I have a bum foot injured in a motorcycle accident about 30 years ago that occasionally
gives me some trouble. Well wouldn't you know that just about time the weather is
staying consistently in the 70's here, the foot decides to act up. So that set me back
as for a week it was tough just to get up and walk. Anyway, I have another 5888UV
hooked up on the bench since I've taken the Yaesu out of the SUV and replaced it with
the newer 5888UV so I have a test rig to set up some hyper channels and see how they
works so I know what to recommend as an alternative. Right now I just have the
U and UV national calling frequencies as channels. And if I hear a CQ I just make
contact and then ask to QSY up a maybe 100khz.

Thanks Milton.
That is very good to know. My truck is loud. The AT5888UV keeps sounding better and better
to me. One exception. I was just reading that the home button doesn't work. That was one
feature that I really wanted to use for the traffic net I work. Hope it is a firmware fix
down the road. Sooner and not later :-) Can't wait to place my order this payday. this
month, one for my truck and next month, one for my house.

Just install two radios, at the low PRICE of the Anytone vs. typical LMR with dual head capability the only issue could be antenna seperation distance and how much would you save even if you could buy just the head?
I can't test the concept you might be able to use two heads by placing a RJ45 A/B network switch box between the radio and heads, I have not seen one of these in a while, I am sure they can be found in surplus stores or on Ebay...
Alternatively depending on distance and use you could buy a second head mount and "parallel" cables going to both mounts and relocate the head as needed. Not sure about signal termination issues, this would be easy and fairly inexpensive to test also.

As a general comment on my radio I received it early February, although it does not perform quite as well as a pricey commerical LMR radio I am very happy with the cost/benefit curve, I didn't expect the features and performance of a $1K++ radio for $300-

It seems that they have pick a frequency in each band to respond
to when you hit the HM. For the left side it's 145.15, 235.15, 350.15 and 435.15.
on the right it's 145.15, 435.15. You can advance through each band by pressing
and holding the channel knob while in VFO mode. Now why they chose these frequencies
I haven't the foggiest but tonight I'm going to try to see if I can change them. They are listed
somewhere in the QPS software. What's I've done is program Hyper 1 and 2. Hyper 1 has
the 2 meter and 70 cm national calling frequencies and is available with a momentary push
of the left volume button. Hyper 2 has two of my favorite repeaters and is available with
a momentary push of the right volume control. This evening I'm going to see if I can expand
that because I think you can add four channels to hyper 1 and 2 for a tota of 8. That should
take care of an oddball home channel arrangement if it can't be altered. Whenever I run into
these kind of situation I remind myself that this is not an amateur radio and wasn't designed
to operate exactly like our Icom, Yaesu, Kenwood, Alinco rigs.

Thought I would make a comment about turning the RF SQL "off". Actually after I got my radio back from Ed with the new CTCSS Firmware upgrade I had 2 channels, vhf on left, and uhf on right, both set with tone encode and decode. I set the RF SQL to "off" and the regular squelch to about 4. The radio worked great and the squelch did not ever break from noise but was easily readable when the repeater was keyed up. These are my two favorite stations and are known to have noise on the channel and one has another repeater about 100 miles away on another tone freq which will frequently get through your squelch if you dont set decode also. If I set the RF SQL to other than off the noise would actually come through when set to s3 or s5 and on s9 there was no noise but sometimes the repeater then would not come through. When scanning other channels with RF SQL "off" although some stations would break squelch sometimes with noise but no sound and it seemed to be different depending on which channel was set to main.

Yeah a while back I made a remark that RF squelch isn't worth a damn on these radios. But the carrier squelch seems to work very well. I've never used RF squelch on anything besides my HF rig where you don't have choice. If the squelch is up, you see no received signals lower than the squelch setting. And that's RF squelch in my book.

I'm replacing the display and the RJ45 mic preamp assembly in my old AT5888UV. I pull the old mic board out and look at the date and revision which is in English and it's dates early December 2012, V4.0. The replacement is around mid December but V3.0. One would think the revision would be a larger increment maybe V4.5 which I'm used to working on Japanese and US LMR gear.

In order to hedge against hemorrhoids you have to show competence in a timely manner when something is bought. And that often people are quick to seize without delving deeper into the situation, then complain. I say this to all forum users do not take offense at me.

Some users are very noisy when going about WARRANTY. As as ham, I don t care about warranty.
For me, there is THE HOLY soldering iron, rosin and tin, and other accessories.

I'm sorry Vitalie but I have as much trouble understanding your rhetoric as I do the Chinese.
My comment was made in jest more or less, that's all no more or less. An observation that made me chuckle and want to share.

In order to hedge against hemorrhoids you have to show competence in a timely manner when something is bought. And that often people are quick to seize without delving deeper into the situation, then complain. I say this to all forum users do not take offense at me.

Some users are very noisy when going about WARRANTY. As as
ham, I don t care about warranty.
For me, there is THE HOLY soldering iron, rosin and tin, and other accessories.

Thanks Milton.
Please keep us informed of your progress. I am very interested.
Quick question for you please. I understand a quick press of the volume buttons gives you a hyper channel for each side. If you press the volume button quickly again does it return you to the channel you were on before you pressed it the first time or is a hyper channel just a memory channel for quick use? I can live with it both ways but I would rather the first. I also wonder if they ment for the Home Channels to be editable but just have not got to adding that feature yet? I am downloading the manual to start reading it. Going to order my rig Tuesday :-) I always like a new play toy :-)

73 de W2EEC

Eric

P.S. Milton. I see that you use a MacBook Pro. How do you program your AT-5888UV? I am not using bootcamp and I don't have Parallels anymore, nor do I own a copy of Windows. What I have been doing is programing my other rigs using a serial cable and DB9 to USB converter (That I have drivers for a Mac) cable sense most USB programing cables that are being sold don't have Mac drivers. My software of choice is Chirp and I see it supports the AT-5888UV now. Awesome. Thanks.

Ok don't quote me on this because I spent just a couple minute with hyper.
I believe once both sides are in hyper-1 (left) and hyper-2 (right) that pressing the volume on either side makes that the active or marshall side. To get out of the hyper mode I believe you press V/M on each side. Sorry I can't verify that, my base is torn apart, well the control head, as I'm in the process of changing the LCD and the mic preamp. I've had so many interruptions I just can't seem to finish the job. And my SUV with the other 5888UV is out on the road at the hands of the Mrs right now.

As far as Mac OSX goes, I can program the 5888UV using Chirp and a the right driver fpr the cable which I've bookmarked. I run a 2012 MacBook Pro with an Intel quad processor and 64 bit OSX 10.8.3. And it works fine. I also run the QPS5888 software on a quad core AMD based desktop and Windows 7 except that software is prone to crash unless you figure out what not to do to make it just vanish from your desktop. My cable for the 5888UV, my Wouxun UV6D, and Baofeng F-11 all use the same genuine Prolific PL2023 XT/HXT chip inside so the one driver for the Mac is all that is needed. As far as Windows goes, I have a separate hub for my 4 cables including an FTDI cable for a GRE scanner and USB to DB9 antique Radioshack converter. They have to stay plugged into that hub or I'd be playing musical chairs with Windows 7 drivers forever. So I've gotten them to the point that they all co-exist with each other especially the old Radioshack USB-DB9. Heck the last driver they wrote for that thing was for Windows 2000! Luckily my IT experience included some tricks I've learned over the years on how to manipulate and full the operating system to get some compatibility and was fortunate to get that old dog Radioshack cable to work. Without buying a new set of cables for my Yaesu FT8900, FT60, and VX5 I would be SOL because I have no serial ports and two DB9 cables for the Yaseu radios.

Some of this is in Spanish but if you know how to install from a pkg installer
It's a piece of cake.
http://changux.co/osx-installer-to-pl2303-serial-usb-on-osx-lio/

Like I said the spanish on the two buttons mean either go back (left button)
or continue (right button) so have a look at the page because this is what
you will see when installing the driver.

It appears that Anytone has screwed me again. Radios arrived Thursday and I quickly shipped 75 radios that had been ordered. I had no reason to look at the frequency on the sticker, so I didn't notice anything out of the ordinary. I have contacted the factory but have not gotten a reply yet. I will contact all customers by personal email on how this problem will be corrected. And it will be corrected.

Not a happy camper,
Ed

Hey Ed,

I'll be one of those 75, probably--I expect my radio on Monday or Tuesday. THANK YOU for letting us know you're aware of the problem and are working on a fix--even before the radios arrive! That kind of concern and service just can't be beat.

Hopefully, it'll be something simple that we can fix without having to send them back for a firmware update!

Thanks again!

It could be as easy as the owner going inside the radio and removing a SMD or unsoldering or soldering a pad. My Alinco DX-SR8/T uses the solder pad method. You can limit the power output to 50 watts by soldering a pad, open up the transmit so the radio transmits anywhere it tunes. I can only imagine how upset Ed is over this. There was no reason in the first place to lock down a radio LMR type accepted to the US ham band plan. But keep your fingers crossed, if there is a way to open the radio up Ed will find out.

On my Yaesu HT I had to cut out a resister to open up transmit freqs. On my Yaesu mobile I had to unsolder one jumper and solder a different one. Sounds like other companies handle it in a similar way. Hopefully, AnyTone will, too.

That being said, I can understand why AnyTone would want to sell two versions of the radio--one with open transmit freqs and one limited to the Ham bands. But I bought the AnyTone specifically for the extended transmit and narrow band capability (for SAR and other public service activities). Without both of those features I could just keep using my Yaesu FT 1802 as a reliable and effective 2 meter mobile rig.

Guess we play Wait-N-See for China to respond to Ed to respond to us. Sigh.

My Wouxun KG-UV6D-Ham only HT will not TX on extended frequencies
and cannot be modified to do so. Yet it is only part 90 accepted. The other
2 or 3 variants of the UV6D all TX extended frequencies. Personally I
don't need to transmit where I'm not licensed to do so but people are buying
these 5888UV radios for LMR service. I hope Ed could take a few moments
of his precious time and if he's offered an explanation by Anytone as to why
they made this change, maybe share it with the group or at least me so I can
relay it.

I also just purchased one of these radios to give me the flexibility on the extended frequencies for public sector work, but it doesn't even include the entire 2 meter band!

I trust Ed will be able to resolve this.

My Wouxun KG-UV6D-Ham only HT will not TX on extended frequencies
and cannot be modified to do so. Yet it is only part 90 accepted. The other
2 or 3 variants of the UV6D all TX extended frequencies. Personally I
don't need to transmit where I'm not licensed to do so but people are buying
these 5888UV radios for LMR service. I hope Ed could take a few moments
of his precious time and if he's offered an explanation by Anytone as to why
they made this change, maybe share it with the group or at least me so I can
relay it.

On my Yaesu HT I had to cut out a resister to open up transmit freqs. On my Yaesu mobile I had to unsolder one jumper and solder a different one. Sounds like other companies handle it in a similar way. Hopefully, AnyTone will, too.

That being said, I can understand why AnyTone would want to sell two versions of the radio--one with open transmit freqs and one limited to the Ham bands. But I bought the AnyTone specifically for the extended transmit and narrow band capability (for SAR and other public service activities). Without both of those features I could just keep using my Yaesu FT 1802 as a reliable and effective 2 meter mobile rig.

Guess we play Wait-N-See for China to respond to Ed to respond to us. Sigh.

Yeah I guess 144-146 and 430-440 is not the entire US allocation. 2 meters is 144 - 148 and .70 meters is 420 - 450 ?

This must be a mistake on Anytone's part. Seems they don't have it together where final testing for quality and operations is concerned. Unfortunately and this is only a guess but the radios will probably have to be flashed to get them back to their LMR coverage. What a slap in the face that will be for Ed to have to go through not one but two firmware flashes that can only be done with a special cable.

I have AT-5888UV and Wouxun KG-UV920P and both dualbanders are full range from factory. An interesting thing is usage of 433 and 446MHz. A lot of people there, chatting with taxi drivers on some frequencies.

144-146 /430-400 is actually the 2m & 70Cm Amatuer bands in England & a few other Euro areas ...
It seems obvious these radios must have been produced to a Euro Importer's specs, but somehow sent here...
We have another 100pcs due in later this month , & I will be emailing AnyTone to be sure We receive the correct units...

The unexpanded specifications for the 5888UV is 144 - 146 / 430 - 466 for TX.
Expanded is 136 - 174 / 400 - 490 TX. So it may be these radios somehow skipped by the little dude who puts the jumper on or diode or solder pad to expand the TX. I'm wondering what these radios Ed got receive? Do they receive 136 - 174, 220 - 260, 350 - 399.995, 400 - 490
or something else?

1576. [Tutorial]Program Cable Pin-Out and Frequency Range Modification

Yahoo group: Anytone_AT-588UV
Date: 2013-05-05 23:00:51 UTC
From: luke_dukeeee
Topic: 1576 Message: 1576

Hi Folks!

- Program Cable
Spent a few minutes on how to pin-out the cable.
I used a standard USB to RS232 (Serial) Converter.
The Cable is a standard CAT5 Cable. The good thing about the CAT5 Cable is that the wire color is always the same.

So I soldered a quick and dirty program cable, which consist a DB9 Jack and a Cat 5 Cable.

Refering to this image : http://www.google.at/imgres?imgurl=http://www.arcelect.com/9_PIN_PIN_OUT.GIF&imgrefurl=http://www.arcelect.com/rs232.htm&h=396&w=468&sz=33&tbnid=DQw_DxWh9QnTqM:&tbnh=90&tbnw=106&zoom=1&usg=__R6v6vgZtKgH-Ha2fs3svuUAIlOw=&docid=eeob8hGjCGJ62M&sa=X&ei=gN-GUd2ON8qNtAaXy4G4Bg&ved=0CEgQ9QEwAg&dur=379

The pin out is :
Rx (Receive Data) -> orange wire from the CAT5 Cable
Tx (Transmit Data)-> green-white wire from the CAT5 Cable
Gnd -> orange-white wire from the CAT5 Cable

Works pretty well!!!
If you need some pics let me know.

-Frequency Range Modification
Just use the software from Intek : http://www.intek-radios.com/?C=Product_H.php&Id=343

And select Band 1 . Then write to the device. The Device reboots (every character the Display can display shows up without the backlight) and then the original orange kinda backlight comes up.

Did this a couple minutes ago and worked pretty well for me.
Hope this is useful to somebody.

Best Regards
Luke

Yeah the Rx/Tx Extend works Pretty well with the Intek Software. But I
can not Read the Channels etc. from the Device cause I do not have the
original Software from Maas. So If anyone knows a way how to get it
would help me!!! Because not even Chirp supports this shit-piece of Maas
Branding Radio. Should have bought the Intek or Anytone one -.-

Heh ok well POS or not hopefully your input will
answer some questions. Personally I'm dumbfounded
in the changes made to these radios since as far as I know
they all should be wide open TX and RX. Please keep us
advised as to what you can discover. Oh and you can email
me off list if you want. Might be a quicker way to share.

Modification

Yeah the Rx/Tx Extend works Pretty well with the Intek Software. But I
can not Read the Channels etc. from the Device cause I do not have the
original Software from Maas. So If anyone knows a way how to get it
would help me!!! Because not even Chirp supports this shit-piece of Maas
Branding Radio. Should have bought the Intek or Anytone one -.-

My only concern (assuming this method works), can someone try to program the radio by hand (using the radio buttons) afterward in the 146 to 148 MHz portion?

The original specs of the radio was: 144 - 146 MHz & 430 - 440 MHz.

The US 2 meter band is 144 to 148 MHz & 440 band is 420 to 450 MHz.

When I travel, or in an emergency situation, I often have to program my radio to a local repeater in another area & don't take my computer with me.

Thanks, Rick

I dont think you can do something special to the radio as by parameters you received EU version of AT-5888UV.

In EU 148MHz is police, fire, emergency, other gov bodies.

Anybody have any luck unlocking this and getting it to open up the frequency range?

Tony

I had success with unlocking of AT-5888UV. My own AT-5888UV has TX 136-190MHz, 220MHz, 350-520MHz. But I made hardware changes. But for newbies or those who dont know what is soldering iron is very dangerous. As if the radio is factory set up 144-146 /430-440MHz, this mean that hardware is tuned exactly to work within frequency range. You can take risk of using of such software to hack the radio, but in this case you should closely check TX SWR.
If the radio is factory setup 144-146 / 430-440Mhz, this mean factory warranty the stable functionality of the radio within this range. Changing factory frequency will cause radio to malfunction, get very high SWR and as result: RADIO DEAD. Every MHz changes significantly SWR. So, for few extra MHz to risk with your radio, i dont think is good idea.

Just Read my other thread on the Intek Mod. Swr is the same! You are only selecting the original Band in the Software! There are two bands which can be programmed!!!

These radios have two micro controllers one in the removable head
for memory of channels, VFO, offsets, and in the radio body another
micro for fine tuning RF circuits to a point within the hardware limits.
My opinion but it's not that far fetched. This is why when you update
flash you do it to the radio control head and the radio body.

As I recall, swr related to power reflected back from a antenna that is
not tuned to the proper frequency. So if you are using an antenna that
is tuned for the ham bands on non ham bands, the reflected power will go up,

I could be wrong because I am not there seeing what you are doing.

As I said before: If owner of radio wants *a stable working radio*, no playing with unlocking software! Only on frequencies set by factory and clearly recorded on the BOX or sticker. But if you want radio with extended frequencies, then get proper radio. A cow can fly guaranteed if you install on the cow copper engines and wings! Pigs songs for sure! Their song is called: GRUNTING.

Thats the point cause you are using a shitty antenna for non ham bands. So the swr goes up. I used a solid quality kathrein which i got from my rescue department. Around 200 bucke for this antenna. The swr is exactly the same.

If you screw up your programming you can restore your radio to factory defaults! This isn't a fucking bios flash or something else. You just set your radio to a other band ! And that band was programmed, tested and sent out to many radios. But this band is not a ham only band!

I thought since there are a lot of people who had this issue would appreciate my work.
I showed you a way on how to save 30 bucks.
And some people are to lazy to read the news page before posting.

I will delete my thread so nobody can complain furthermore.

Ps: PAs are hardware things not a stupid integer in c#!

why would I want to do that?? the heat sink on the radio could not
handle that. It is not sized for that type of heat dissipation.

would the swr go up if you had it hooked to a quality dummy load ?? no.
check your antenna, it's not tuned for the extended frequencies.
tune your antenna, and the swr's will drop back in line.

Good idea! Why not to try modify the radio to give TX 100W?

Got my radio today. First thing I did was run the Intek software to reset it. Worked like a charm. I used Chirp to program it for all my "normal" simplex and repeater freqs. I was able to talk with a friend on 146.82 and 146.55. For grins I tried hitting a public service repeater in the 155 area--no problem.

Certainly appears to have unlocked the radio.

:-)

My only concerns:

1. The AnyTone software doesn't work right on my computer because I don't have enough lines on the screen (I think). I can adjust a bunch of the function stuff, but can NOT do any channel programming. So, I used CHIRP for channel programming, but . . .

2. CHIRP doesn't appear to be set up for any of the function stuff! Not a big deal as I can work around it. But still kind of an irritant. Perhaps CHIRP will add in the rest of the programming features with a later release? I hope so. But, like I said, I can work around it.

As I said before: If owner of radio wants a stable working radio, no playing with unlocking software! Only on frequencies set by factory and clearly recorded on the BOX or sticker. But if you want radio with extended frequencies, then get proper radio. A cow can fly guaranteed if you install on the cow copper engines and wings! Pigs songs for sure! Their song is called: GRUNTING.

From: Tony
Topic: 1558 Message: 1599

The problem is this... the radio was sold as being able to tx on channels that it is not currently txing on because of some lock in either the software or the hardware. The radio I bought, or should have received was supposed to have a Transmit Range (FM) 134-174, 400-490 MHz. It does not, not even close. Without having access to the public service bands it is worthless to me. If this radio can be simply flashed to operate in the advertised range then good, if not, I want what I ordered or I want my money back. Simple.

```
Simply unlock the radio as described and you'll have exactly what you'd have gotten if
you'd have gotten an unlocked radio. Except for the label on the box. Done deal.
```

Here Tony is perfectly right!
The radio should work ONLY in frequency range described by factory on the BOX or sticker.
All US and Canadian hams has maximum freedom using amateur radio. What I cannot say about eastern european amateurs, especially in MOLDOVA, Ukraine, and mostly Russia.
There the Radio Center specialists has rights to visit your house with police without prior warning to check your equipment if equipment works within range. And if they finds that your radio is working out of the bands described on BOX or sticker, by law they have rights to confiscate the radio and suspend amateur license.
If on the box or sticker of your radio is written clearly: 144-146 /430-440MHz, the radio MUST WORK ONLY in this range! Tony mentioned that TX 136-174 /400-490MHz and if he ordered radio in this range, then RADIO MUST work from factory in this range, but if buyer ordered 136-174 / 400-490MHz and received 144-146 /430-440MHz, is the failure of supplier: or supplier replaces the radio, or he refunds money back! Simple as 2+2=4.

From: kingfish_stevens
Topic: 1602 Message: 1602

Since someone seems to have had trouble using the unlocking software, I have tested it several more times.

I have posted a new file for download at
http://www.wouxun.us/UnKill_Software/Frequency_Reset_Software.zip

This zip file has the latest programming software, the unlock software and detailed instructions on using the unlock program. I have installed both on a previously unused computer and tested them both on a couple out-of-the-box radios. Both programs did their job. Please read the INSTRUCTIONS-READ-FIRST file before doing anything else.

Any problems from here on, I can only assume are driver, cable, Windows issues or operator error.

Regards,
Ed Griffin

Topic: 1603 Message: 1603

Ed came through!! My radio was one that wasn't working over the entire band. I tried several fixes and was frustrated. I wasn't getting the correct software from him for some reason, what he sent today worked like a charm! Plugged in, flashed, up and working in about 1 minute. Perfect..... Getting the full spectrum of TX now.

Thanks Ed for your tenacity and putting up with me.

Tony

Vitalie, here in the US things are a bit different than in your country. There is no law against OWNING a radio that can transmit on pretty much any frequency. The laws are against actually using the radio to transmit on a freq you aren't authorized to use.

As Amateurs we have specific bands and freqs and we have to operate inside them, in most situations. If we have a radio that has been locked at the factory to use less than our allowed freq ranges there is absolutely nothing wrong with unlocking the radio and opening up the transmit freqs.

If the radio is then capable of transmitting outside our authorized spectrum it is up to the operator not to transmit in the wrong place.

That being said, as Amateurs, we can use whatever means of communication is available to us during an emergency. If that means operating on freqs that are not generally authorized for amateurs, so be it. If that means operating a radio outside it's factory settings, so be it.

The caveat is that we, as operators, are responsible for following the sometimes nebulous laws and regulations--and, if necessary, defending our actions in court. Which means it better be a REAL emergency to operate outside of authorized spectrums.

The other issue with these radios, and one that applies to me, is that many of us are both Hams and volunteers for various public service entities--many of whom use frequencies these radios are able to work if they are unlocked. Many of us bought these radios BECAUSE they can work the public service freqs. If I didn't need the public service freqs I would have gotten a Yaesu FT8800. But I need the the expanded tx freqs and also the Part 90 emissions compliance including narrow band. Ham radios don't have that. So, I got one that does.

And then I promptly unlocked it from the factory settings so it will do what I need it to do. And, here, that is perfectly legal.

Sorry for being so long winded. But you seem to be confusing the requirements in your country with the requirements in the US and there are some significant difference.

Right here.

As I said: Why not to have from factory FULL range 136-174/400-490MHz? Is better to have only 144-146/430-440Mhz radio instead of FULL Range? I dont think so.

If you have full factory range radio, then unlocking radio is absolutely not necesarily because it already TX on all VHF/UHF. Is non-sense to buy 144-146/430-440 when you can buy 136-174 / 400-490MHz. Another thing you want to change modulation or sensitivity.

_I do not see any sense to unlock a radio for extended frequency when you can get already factory set up radio for all frequencies.__
_
I am also volunteering and _authorized _to use gov frequencies in case of disaster or other natural problem.

Why I said all this stuff is for other hams to save their time, nerves and use radio with proper TX range.

1617. X-Band Success!

Yahoo group: Anytone_AT-588UV
Date: 2013-05-09 17:37:40 UTC
From: sailorgriz
Topic: 1617 Message: 1617

I got my AnyTone on Monday, fixed the transmit frequency issues, and have been "playing" with it on and off since.

Today I tried x-band to reach the repeater from out on the farm. My HT has a hard time getting to the repeater on its own. But, it has an easy time getting to the house and base station radio from anywhere on the farm. And, with x-band, I can use that ability to work the repeaters in the area.

It's a nice feature that I never had a use for--until I tried it.

I did notice, however, that on high power the radio gets a bit warm with lots of usage since it's transmitting all signals. Turning down the power helped considerably--and is the right thing to do, in any case.

By all means use the lowest power settings possible. One thing
I do is lay a 120 mm computer fan right on top of the radio. It's
12 volts so no problem there. Direct the airflow down onto the
cooling fins and the radio will stay nice and cool. 5 watts for me
is plenty to get into the repeater I have trouble with. It's a Skywarn
repeater and the net goes up when the NWS when severe weather
watches are issued for our district. And I don't like to be stuck in the radio
room on the base radio.

From: Milton Hywatt
Topic: 1615 Message: 1620

Not sure if the software displays minor incremental
changes to the firmware. I have two different radios
with different firmware versions and they both report
1.00. You should probably get ahold of Ed and tell him
your problem still persists and where to go from there.

Subject: [Anytone_AT-588UV] Firmware version and tone decoder

Hi everyone, I sent my radio back to Ed to have the firmware updated to fix the Tone decoder issue but it seems to still have the issue after I got the radio back from him, I checked the version of the radio firmware and its says its version 1.00. I was wondering if that is the current firmware version or if other users are currently running a new version greater then 1.00.

Thanks
Mike KC9TVS

Milton..
The two channel features of the radio make it an excellent tool for monitoring the Skywarn Net, and be able to discuss local conditions with other hams. like (is it raining there yet?, I have winds out of the NW at 35 MPH at my QTH, or my yard is underwater etc.)

By all means use the lowest power settings possible. One thing
I do is lay a 120 mm computer fan right on top of the radio. It's
12 volts so no problem there. Direct the airflow down onto the
cooling fins and the radio will stay nice and cool. 5 watts for me
is plenty to get into the repeater I have trouble with. It's a Skywarn
repeater and the net goes up when the NWS when severe weather
watches are issued for our district. And I don't like to be stuck in the radio
room on the base radio.

I got my AnyTone on Monday, fixed the transmit frequency issues, and have been "playing" with it on and off since.

Today I tried x-band to reach the repeater from out on the farm. My HT has a hard time getting to the repeater on its own. But, it has an easy time getting to the house and base station radio from anywhere on the farm. And, with x-band, I can use that ability to work the repeaters in the area.

It's a nice feature that I never had a use for--until I tried it.

I did notice, however, that on high power the radio gets a bit warm with lots of usage since it's transmitting all signals. Turning down the power helped considerably--and is the right thing to do, in any case.

It sure does. And we might be using it tomorrow. However when the National Weather Service issues a warning, there is no chatter about "it's raining hard here" or "a lot of lighting" it emergency traffic only like power lines down or sparking, large hail, info from spotters looking at wall clouds and net control asking spotter to go to a certain location or look in a certain direction since net control is always looking at real time doppler radar. So yes when there is a warning there is no BS on the net. It's run very well here and after the storm has passed and the warnings have expired then damage reports can be given. That all gets relayed to the NWS.

You have to export the info from your Wouxun config. Then open a clean config for the anytone, import the config to that and then it will upload to the anytone.

You have to read the source radio and then EXPORT to a CSV File. Then read the destination radio and IMPORT the desired CSV file from the Source.

Can't upload the file from one kind of radio to the other.
You have to download from your 5888UV and the UV3D.
You'll get separate tabs for each radio. Go into the UV3D
template and copy the entire row then tab over to the 5888UV
template and try to past that into whatever row you want.
This is how I did it between my Yaseu FT8900 and my 5888UV.
Now I had to make some minor adjustments but I got most of
the channel data identical for both radios including channel
names. Chirp also has the ability to download from your county
active repeaters into the 5888UV template. This is under Radio,
Query Data Source, RepeaterBook. Give it a try and let me know
how you do. But no you can't upload the template from the Wouxun
directly into the 5888UV.

Run CHIRP
Connect first or source Radio
Top of Screen select Radio and download from your Source radio
File Export - maybe name it Source.CSV
Now connect second radio
Select Radio, Download the second radio
Now File Import Source.csv and the first radio contents are in Chirp
Write to second radio and it is programmed same as first radio.

I kind of miss being part of SkyWarn. I was pretty active for awhile in Wisconsin. Out here in Idaho we don't even have a SkyWarn--we just don't get the kind of weather one has to warn about! The occasional blizzard or severe winter storm but they don't need to be warned in real time like T-storms and tornados.

I do NOT miss the weather that caused SkyWarn to be active back there! But I did enjoy being on the 'nets.

Subject: [Anytone_AT-588UV] Re: Help with Chirp

Run CHIRP

Connect first or source Radio

Top of Screen select Radio and download from your Source radio

File Export - maybe name it Source.CSV

Now connect second radio

Select Radio, Download the second radio

Now File Import Source.csv and the first radio contents are in Chirp

Write to second radio and it is programmed same as first radio.

Something just occurred to me- older versions of CHIRP do not include AnyTone support. If you can't find AnyTone in the Radio Download menu, you need to get a more recent version of CHIRP.

> John is correct. You should use a version of CHIRP that is compatible with
both radios. The CHIRP website says the AnyTone is supported in the daily
builds so if you are using the v0.3.1 stable, you will have to upgrade.

Also, you don't have to export from the Wouxun image to a .csv file and
then import the .csv file to an Anytone template. Here's what you do...

Load a saved Wouxun image into CHIRP or download from the Wouxun into
CHIRP. This will give you a tab with a Wouxun template containing the
Wouxun's channels. Now download from the AnyTone into CHIRP. That will get
you a second tab with the needed AnyTone template. All you have to do now
is cut and paste from the Wouxun tab to the AnyTone tab. Once you are happy
with your AnyTone template, you can upload it to your AnyTone. Don't forget
to save your AnyTone template to an image file so you can use it for
channel and settings changes in the future.

I suggest joining the Chirp mailing list and asking your programming questions there.

http://intrepid.danplanet.com/mailman/listinfo/chirp_users

I use Chirp on Mac OSX Mountain Lion, it's really not that difficult for even the novice to master. And as always if you run into a snag or bug, there is the list or you can contact me off list.

Milton, didn't fry all my brain cells during my youth.

I really like your emphasis on the required information on the nets when reporting severe weather activity.

I am a member of Cobb County, GA, ARES, and we are frequently activated for severe weather activities. The last one we had, there was a new ham that was reporting on the items as reported on one of the local television stations.

We plan to make announcements during the next activation on what to report and what not to.

I will be using my Anytone 5888 next weekend at the N4B Special Event Station at Bert Adams Scout Reservation as a cross band repeater.

We will be active from Friday, May 17 through the end of day on Saturday, May 18.

We will be using the x band function for our local use and for the Boy Scouts that are licensed amateurs.

Other activities will be on the suggested BSA Frequencies.

For more information, please check us out at N4B on QRZ.COM

I really like my rig and it works as well as expected.

It sure does. And we might be using it tomorrow. However when the

National Weather Service issues a warning, there is no chatter about

"it's raining hard here" or "a lot of lighting" it emergency traffic only

like power lines down or sparking, large hail, info from spotters looking

at wall clouds and net control asking spotter to go to a certain location

or look in a certain direction since net control is always looking at real

time doppler radar. So yes when there is a warning there is no BS on the net.

It's run very well here and after the storm has passed and the warnings

have expired then damage reports can be given. That all gets relayed to the

NWS.

Milton..

The two channel features of the radio make it an excellent tool for monitoring the Skywarn Net, and be able to discuss local conditions with other hams. like (is it raining there yet?, I have winds out of the NW at 35 MPH at my QTH, or my yard is underwater etc.)

By all means use the lowest power settings possible. One thing

I do is lay a 120 mm computer fan right on top of the radio. It's

12 volts so no problem there. Direct the airflow down onto the

cooling fins and the radio will stay nice and cool. 5 watts for me

is plenty to get into the repeater I have trouble with. It's a Skywarn

repeater and the net goes up when the NWS when severe weather

watches are issued for our district. And I don't like to be stuck in the radio

room on the base radio.

Subject: [Anytone_AT-588UV] X-Band Success!

I got my AnyTone on Monday, fixed the transmit frequency issues, and have been "playing" with it on and off since.

Today I tried x-band to reach the repeater from out on the farm. My HT has a hard time getting to the repeater on its own. But, it has an easy time getting to the house and base

station radio from anywhere on the farm. And, with x-band, I can use that ability to work the repeaters in the area.

It's a nice feature that I never had a use for--until I tried it.

I did notice, however, that on high power the radio gets a bit warm with lots of usage since it's transmitting all signals. Turning down the power helped considerably--and is the right thing to do, in any case.

Thanks. We do take our weather here seriously. We're not in
tornado alley but have had our share of sightings, straight line
winds that knocked down healthy trees 24" or more in diameter.
In April 2002 I watched large oaks and maples topple to the ground
in the wooded area behind my house. That was from the remnants
of a tornado that went back up then came back down a mile later
and did even more damage.
Missed me by 200 feet but knocked our power out for 36 hours.
Luckily I had a generator.

When you are in the menu item pressing the Main encoder knob
momentarily will take you into the function menu of that item.
So go to Set, then rotate the Main encoder knob to item #52
VSPCONT. Press the Main encoder knob momentarily to enter
the function mode. You can then rotate the Main encoder knob
to select between int and ext. That is the function mode.

I'm trying to get the radio to send the sound to the correct speaker. The left side to left speaker and the right to the right speaker. You are supposed to be able to run a pair of computer speakers. But right now the sound of both are going to same speaker. If I plug the speakers in the other speaker jack the sound of both sides comes out of the other speaker.

Acording to the book on page 29 VHF external speaker port your supposed to be able to adjust that. Only I push the key button and it doesn't enter the function menu.

1654. Sub band mute when main band Tx

Yahoo group: Anytone_AT-588UV
Date: 2013-05-10 19:13:48 UTC
From: Alfred Chovanetz
Topic: 1654 Message: 1654

This is real handy when monitoring a cross band repeater and you transmit
To that repeater and need to monitor the both sides when not transmitting. Found a bug on setting the 5888UV to do the above.: sub band rcv Rx is muted when main band does Tx, and function is set up correctly for mute sub only if main does tx. However when subband is set to mute it also mutes several other channels randomly (does not mute all), with no tx'mitting on main band and sub band set to scan. Those that it mutes while main is in standby do have a coded squelch. Only way to hear all channels scanning on sub band is to set Rx-mute function to off. Anyone have a suggestion?

I wish that we could get ARES/RACES to operate a severe weather net here in the Beckley, Raleigh County, West Virginia area. They are all lazy! I tried but got no response from anyone, not even "It's raining here!" report. Glad to see you all are doing it!

From: electrician2000
Topic: 1656 Message: 1656

Hello all, I know there is not a very good chance of this but I wanted to ask. Is there any chance of a service manual coming out for this radio from Anytone. I have checked out the fcc site but it is not a form that is available to download and see.
Thanks
Nick

1657. Re: [Anytone_AT-588UV] Service Manual

Yahoo group: Anytone_AT-588UV

From: Milton Hywatt
Topic: 1656 Message: 1657

I asked Ed from Import Communications to see if he could get
me something, anything, block diagram, component layout, anything.
Anytone was too afraid of the literature getting into the wrong hands
and having their design stolen.

So is there anything available at this FCC site the you can view online?
If so you can always do screen captures. And this is one thing that scares
me when the radio warranty is over. Who is going to fix it?

i purchased the export model At-588UV direct from China $275US all up shipping included delivered (to Australia)with programming cable which is open TX not blocked. Which by the way works well, better than the USA version AT-5888VU as the Chinese sellers advise with the firmware that limits the radio. I would disregard the USA version and just buy the export version, the software allows you to set the band limits. And if you buy the radio direct from China the radio comes shipped included with programming cable. FCC is just paranoid fat ass ham representation over zealous twits that does not represent world whoever they are, certainly zero impact here

I own two AT-588UV radios imported to the US and neither are limited.
The only radios limited were mistakenly shipped as far as I can tell. And
the limited radios can be unlocked so it wasn't a real big deal except some
people like to make it a big deal.

From: Milton Hywatt
Topic: 1663 Message: 1663

First radio serial #200019. I'm pretty sure that was
#19 after official production started so it's in need
of a flash but not desperately as a base station.

I had dialog here with someone about cross band settings.
He mentioned that the letters RPT not appearing after
pressing the encoder knob with X-Start displayed.
The old radios will not indicate anything. However
sure enough it is in cross band mode and it works very
well. Mine is set up for the left side to be the UHF
remote and the right a VHF repeater I have trouble
getting into with my HT. And while in cross band mode
the right encoder knob can be turned and will stay in
cross band mode.

Second thing I noticed is that when the channel spacing
is set to 12.5 khz, instead of 'nar' appearing on the bottom
under the frequency or name, the letters MT appear. I don't
have the old owners manual so I don't know what MT stands
for. However that's what appears in 12.5 khz mode. And I don't
think there is a MID all you have is wide or narrow with an older
radio not yet flashed.

My newer #20185 radio still needs the CTCSS flash but it doesn't
effect my operation. And it displays all the things correctly. I even
tried swapping heads and sure enough the settings stay with the control
head.

Juat a couple things I thought worth sharing.

Hmmmm.....scratches head.....MT = empty?
Zip, the channels aren't empty, just narrow
in size. I was thinking more along the line
of Memory Tune? But how would that fit?

I guess I need someone with an old manual
to check out what MT means in the display
description. I just recently deleted the old
manual PDF darn it but you know what?
Apple Time Machine !! YEAH! I have a backup.

Scurries off to get backup drive..

1666. Anytone Xband and TV/AV

Yahoo group: Anytone_AT-588UV
Date: 2013-05-13 11:57:51 UTC
From: wndgst
Topic: 1666 Message: 1666

Hello to all,

This is my first time posting. I just received my Anytone less then 1 week ago and so far so good. I have a few questions and I hope someone can help.

1) I am trying to do something a little off the wall with my Anytone.
I own 2 repeaters and I want to use the AT-5888uV has a xband between the 2.
one side is on 2 meters the other is on 440, I set the crossband up
with no problems, The one issue I have is the anytone will sometimes
get caught up in a keying loop. What I mean is, it will send 2 or 3 bursts of what could be explained has opening the squlch and closing it quickly after someones uses the repeater. I have tried RF squelch and just plain squelch I can not figure where the problem might be. I tried my TMV71A, setup it up the same way and everything works fine. So I guess I am missing something in the setup of the Anytone.
Any Ideas ?

2) I saw a pic post one the site, In there software package they had
a TV/AV option in the software. I do not have this option and I have version 1.00 I looked around and could not find a newer version.

Thanks for any help

Dan

We have seen your squelch burst problem and solved it by using CTCSS tones. Similar setup between 2m and 440 but with Motorola radios rather than AnyTone.

Subject: [Anytone_AT-588UV] Anytone Xband and TV/AV

Hello to all,

This is my first time posting. I just received my Anytone less then 1 week ago and so far so good. I have a few questions and I hope someone can help.

1) I am trying to do something a little off the wall with my Anytone.
I own 2 repeaters and I want to use the AT-5888uV has a xband between the 2.
one side is on 2 meters the other is on 440, I set the crossband up
with no problems, The one issue I have is the anytone will sometimes
get caught up in a keying loop. What I mean is, it will send 2 or 3 bursts of what could be explained has opening the squlch and closing it quickly after someones uses the repeater. I have tried RF squelch and just plain squelch I can not figure where the problem might be. I tried my TMV71A, setup it up the same way and everything works fine. So I guess I am missing something in the setup of the Anytone.
Any Ideas ?

2) I saw a pic post one the site, In there software package they had
a TV/AV option in the software. I do not have this option and I have version 1.00 I looked around and could not find a newer version.

Thanks for any help

Dan

The way I have me system setup I do not want to use a tone.
My 440 repeater has a simplex link to 2 meters. If I add a ctcss
there is a possibility someone might be using the freq and they would not be heard with out the correct ctcss or even hear the simplex link if they did not know the tone. I have tried the same antenna and setup with the V71A and it seems to work great. This maybe an Anytone issue, I tried to use RF squelch but s9 is to much and s5 is to low there are no in-betweens. So far happy with the radio, except for problem I have described. Anyone have an answer on the software and where I find the TV/AV setting has I saw on a previous post pic.

Dan

Yes I did try left and right squelch. Used all the values, Just could not stop the squelch tail from looping 2-3 times. I will have to use the TMv71A to do what I need. I bought the anytone for this purpose and seems I may not be able to do the crossband with it.

You push Set to enter the Set mode. Then rotate the Main encoder (channel) knob to the item number you want to set. Then press the Main encoder knob to enter the function menu for that item. Example: Wide/Narrow setting. Press Set. Rotate the Main encoder knob to item #43 WIDNAR. Press the Main encoder knob to enter the function menu of the Set item #43. Rotate the Main encoder knob to select from WIDE MIDDLE NARROW. Once selected press Set to save and exit the Set mode.

The Anytone radios have been known, not as a whole, but in part to have
some issues with UHF and VHF interfering with each other on sides A/B
on certain frequencies. Sort of like the radio picking up a birdie generated
by the radio itself. You may try the clock shift or setting one side up to decode tone.

I'd forget about the TV/AV function.

Press the V/M buttons on each side of the radio. Make sure that you can switch the radio between VFO and Channel mode. The radio will enter the Set mode from either VFO or Channel mode. When you momentarily press the Set button, the side of the radio designated as the Main side by the little main icon in the corner is the side of the radio that you will use to select the set item and then press the encoder knob to enter the function menu of the Set item. If your radio does not do this then try a factory default reset by holding down the right SCN button why turning on the radio. This will erase any programming you previously had. After all these instructions you still cannot get the radio into the Set mode then into the item Function mode, contact your supplier and suggest the radio is defective.

I have tried to follow your instructions. It will not go into set mode from either VFO or Channel mode. After a couple of trys it loses the number1 channel on both sides. I thought that was curious. The radio would go into set mode when I frist started working with it. I have cleared the memory several times and reloaded it. This doesn't seam to make any difference. Based on the info so far, do you think the radio has a memory or programing problem. Stan... KB9UFW

Stan, my 85 year old mother can maneuver through the menu system at my direction. She can't even turn on a computer. I visited her yesterday for Mother's day and took her out to lunch. Remembering how much difficulty you seem to be having with your radio I thought maybe it was the way I was explaining things to you. So I had mom follow my instructions exactly as I explained them to you. She had no trouble going from VFO to Channel modes on both A/B sides. She had no trouble knowing what mode the radio was in. I gave her instructions on how to start the crossband repeater function and she was able to do that. So I feel I've gone far and above making certain you are getting as accurate and user-friendly advice as I can possibly give. At this point I feel you likely have a hardware issue and as my last reply, appeal to you to contact your point of purchase and discuss returning the radio for an exchange.

From: w3pcj
Topic: 1681 Message: 1681

Hello all.

I am thinking of getting the AT-5888UV and need some help in choosing the right mobile antenna for this radio. I am a ham radio operator and work with RACES, CERT and our county EOC team. When needed we are permitted on the county 911 frequency's.

My question is will a ham antenna with 2M and 440 cover the entire TX on this radio or is there a better choice for this use. My vehicle is set up for NMO type antennas.

Thank you for your time.

-Paul

Hello!
Some antennas, such as the ANLI WH-717, are tuned to cover the full range, otherwise the alternative is to keep 2 or more antenns and swap as needed ...

I am using a Diamond NR770HNMO for Ham and Commercial VHF and UHF and it works just fine. Several others in the area are using this antenna also.

Thanks for the info and suggestions. I can always get the NMO to SO-239 Converter Adapter to use with my vehicle.

All the best

1686. Re: [Anytone_AT-588UV] Antenna selection

Yahoo group: Anytone_AT-588UV
Date: 2013-05-15 15:29:47 UTC
From: Milton Hywatt
Topic: 1681 Message: 1686

Typically a dual band gain type antenna like the Comet 750A or Diamond SG7500 will provide a 2:1 or under SWR from 144 - 148 and 420 - 450. I have both antennas and they are wider banded
on 2 meters than on 70 centimeters. 2 meters is around 1.8:1 on each end with
a dip to just above 1:1 in the center. 70 centimeters is 2:1 on each end with a dip to around 1:1 in
the center of the band. Took me a while to tweak the antennas but that's what I ended up with. Since
I'm not licensed to transmit anywhere else I couldn't tell you what to expect out of band but if the
bandwidth of these two antennas is any indication, your results probably will not be favorable.
Is there a better suited antenna? That would be a question for the antenna manufacturer.

Topic: 1687 Message: 1687

Greetings All,

I have an AT-5888UV that was delivered on May 3rd. I've tried using the software recommended in the manual as well as the latest daily version of Chirp. When I try to download the radio from Chirp i get an incompatible firmware error and when I use the QPS software I get;
Model type is wrong. Overwrite?

PC is QX588UV
Radio is AT588UV

There is only an OK button on the bottom. My question is does the radio have old firmware or is the firmware so new the software is not out yet or does someone know where I can download it. I love the radio and appears to work fine, it would just be nice to customize it without all of the manual labor since I have the cable to use with the software.

Thanks for any help you can offer.

Sal

I've found that you need to download from the radio a template even if it lacks any channels etc... Then modify that template to your choice and the send that template back to the radio.

let me know if that helped.

Thanks for the quick response. Unfortunately its the downloading from the radio that gives me the error. Although the box asks the question to overwrite there is no yes or no, only the ok which ends the process.

Did you get your radio from Import Communications, or some other vendor?
Almost sounds like not the right radio for that software

Similar thing happens with my scanner programming software which supports
certain GRE or the equivalent RadioShack version, but you have to make sure
you select which actual one to download from.

Gentlemen.. (and YL's)
There is a very good (build it your self) two bander "J pole" at

http://www.w4cll.com/ijpole.html

You can purchase the 3/8 aluminum rod and a 3/8" threading die at most
Ace Hardware stores.

Radio Shack and many "Truck Stops (cheaper)" have the SO connector.

These things are amazingly flat all across the band and Work very well
on cross band with the AT-588UV

Our LARC radio club has built over 2 dozen of them as class construction
projects..

Hi Paul.

I can see you want a mobile antenna.
I can recomend Comet CA-2x4SR-NMO which is also tuned to emergency frequencies.

Regards from Denmark

That's probably an easy fix. But the software really shouldn't need to ask to overwrite anything. Just as a test, before uninstalling and reinstalling the software try to delete the files in the default directory they are stored in. If you have been successful and have saved a template then don't delete that, make a sub directory and move it. I'm not sure if the program sees a default template name and cannot save what's read from the radio because of that but I would think the software designer would have been thoughtful enough to consider that possibility. I know the software is buggy as batsh*t, maybe this is just another. If kj4zfo still has problems I can try to recreate what I think might be happening. What I did was save my files to a different directory. Although this creates an extra step because the QPS software always looks in the directory it created you have to go to file, then open then go to where you've saved your template file.

Did you try the QPS588UV software located at
www.wouxun.us/item.php?item_id=295&category_id=64

Thanks for the quick response. Unfortunately its the downloading from the radio that gives me the error. Although the box asks the question to overwrite there is no yes or no, only the ok which ends the process.

Goto
www.crtfrance.com
Use the contact form and ask for the software for free.
After you send the hotline the invoice, you will get a link with the CRT 270M software for free

Hello All,

I tried to delete files in the directory until the software no longer worked. I've also downloaded the software from the wouxun.us web site, same issue. The QPS software still says that the radio is an AT588UV and the PC is a QX588UV. I'm surprised that no one else is seeing this issue, I'm using a Windows7 PC.

Thanks for your continued assistance.

Sal

That's probably an easy fix. But the software really shouldn't need to ask to overwrite anything. Just as a test, before uninstalling and reinstalling the software try to delete the files in the default directory they are stored in. If you have been successful and have saved a template then don't delete that, make a sub directory and move it. I'm not sure if the program sees a default template name and cannot save what's read from the radio because of that but I would think the software designer would have been thoughtful enough to consider that possibility. I know the software is buggy as batsh*t, maybe this is just another. If kj4zfo still has problems I can try to recreate what I think might be happening. What I did was save my files to a different directory. Although this creates an extra step because the QPS software always looks in the directory it created you have to go to file, then open then go to where you've saved your template file.

1701. Re: High pitch whine on received audio?

Yahoo group: Anytone_AT-588UV
Date: 2013-05-19 21:51:45 UTC
From: joe
Topic: 536 Message: 1701

Hi all
I did a video (sri for poor quality) http://www.youtube.com/watch?v=hgPF4UrSkUg
you can see what happens, if squelsh is open volume is half and than reducing the volume till its "quiet" you see the tone has 10-15db and 4500 hz. Raising the volume and the tone doesnt affect the acoustic noise.
The same you will hear, and after that you hear the tone is overlaying the signal of a repeater.

> After doing a little research on the net, I found this review by PD0AC
>
> "RX audio is not very pleasant to listen to. There's such an amount of distortion that's is not something which is only measurable, but clearly audible. The audio amplifier also spits out a generous amount of noise, even when the volume is turned down to a minimum. On top of all this there's an annoying high pitched tone present when the squelch opens. My frequency counter, DSO, nor spectrum analyzer were able to isolate the frequency due to the reported noise and distortion. I eventually managed to pinpoint the frequency by tuning my function generator until both tones were zero beat. I ended up at 4000Hz, give or take a few Hz."

1702. Printing the AT-588uv down load pgm

Yahoo group: Anytone_AT-588UV
Date: 2013-05-19 21:55:35 UTC
From: djeerings
Topic: 1702 Message: 1702

A young kid came into my office and I was showing him how easy it is to program the AT-588UV, Then I mentioned that I cannot print it.

He sat down, held down the control key and pushed the (Print Screen) key once.

He then Went out of the program and went to "Word" in Windows (XP) and pasted in. Some how haven't been able to do it. Darn these smart young kids.

I don't understand what this means "The QPS software still says that the radio is an
AT588UV and the PC is a QX588UV".

Your sentence reads like this. 'The QPS software says the PC is a QX588UV'. Just exactly
where are you
seeing QX588UV?

Hello All,

I tried to delete files in the directory until the software no longer worked. I've also
downloaded the software from the wouxun.us web site, same issue. The QPS software still
says that the radio is an AT588UV and the PC is a QX588UV. I'm surprised that no one else
is seeing this issue, I'm using a Windows7 PC.

Thanks for your continued assistance.

Sal

That's probably an easy fix. But the software really shouldn't need to ask to overwrite anything. Just as a test, before uninstalling and reinstalling the software try to delete the files in the default directory they are stored in. If you have been successful and have saved a template then don't delete that, make a sub directory and move it. I'm not sure if the program sees a default template name and cannot save what's read from the radio because of that but I would think the software designer would have been thoughtful enough to consider that possibility. I know the software is buggy as batsh*t, maybe this is just another. If kj4zfo still has problems I can try to recreate what I think might be happening. What I did was save my files to a different directory. Although this creates an extra step because the QPS software always looks in the directory it created you have to go to file, then open then go to where you've saved your template file.

Thanks for the quick response. Unfortunately its the downloading from the radio that gives me the error. Although the box asks the question to overwrite there is no yes or no, only the ok which ends the process.

1704. Re: [Anytone_AT-588UV] Re: High pitch whine on received audio?

Yahoo group: Anytone_AT-588UV
Date: 2013-05-19 22:02:10 UTC
From: Milton Hywatt
Topic: 536 Message: 1704

I use an external speaker that limits frequency response to 3Khz.
Quiets the higher frequency, internally generated noise down.
In a mobile application you probably wouldn't need the filtering
because the ambient noise is higher and you would have a higher
volume level if we are on the same page as the noise. And the noise
at least on both my radios is limited to UHF. VHF is pretty clean.
If your radio isn't similar you might consider there is something
wrong with it. But yes these are noisy with the internal speaker
and the mic speaker especially on UHF.

Just a wild guess- Try running the program and select Model from the menu and make sure Frequency is Band 1.

1706. Priority Scan?

Yahoo group: Anytone_AT-588UV
Date: 2013-05-20 01:33:32 UTC
From: w4iwk
Topic: 1706 Message: 1706

I assumed that I could set channel scan to all my channels on one side and Priority Channel Scan to a few priority channels on the other side. But when I set menu 35 to MEN or MSN, both sides change.

Is that the way it works or am I doing something wrong?

Thanks,
Irv W4IWK

Scan setting is universal- ie both sides. A & B are separate radios, but there is only one controller.

From: Garrett Ramsey
Topic: 536 Message: 1712

1) There was a very annoying clicking sound from the speaker during scanning.
2) The scanning speed was so slow it was useless. It scanned 3 channels a second, at best. I would miss entire conversations before it got through the scan list.
3) 700+ channels, but no ability to separate them into groups.
4) Poor audio quality/output. You can forget trying to hear radio traffic if the windows were rolled down. And there was no bass to the speaker.
5) Poor Tx/Rx quality. I could hit repeaters better with my 4 watt Kenwood TK-3180 portable.

I guess I am spoiled to the quality of Kenwood commercial radios, which is what will be going back in my vehicle!

Regards,
Garrett

Hi Garrett
I will try to insert a external low pass filter in NF, will see.
BTW what are the other reasons?
tnx

Just bought a nice little Dell Latitude 12" Windows XP Laptop from Ebay, specifically for my radios/scanners I had already converted my main machines to Win8 so a dedicated machine where I know I won't have driver issues seemed like the ticket

I know there is a setting in one of the .ini files you modify to not check for connection to the radio when firing up the software, but I can't remember/find that setting.

Hints?

If I am remembering correctly, Go to the QPS88UV folder and then to the Language folder and then to file MySetup.ini and use an editor to change IsFirstRun=1 to 0.

I agree the AT-588(8)vu is a terrible when used in a mobile situation. Inter-mod is the one thing that really sucks with this radio.

However my TX reports have been really positive, and the audio is clear and loud enough even with one window open. But there is this noise on the UHF side.

Will be letting this one go, I feel the Wouxun is a better radio, but the menu system takes some getting used to.

Anytone so far has failed and would advise people to steer clear of this one until the inter-mod issues are sorted.

I've been using my 5888UV as mobile for a month now. Had a couple issues that were relatively easy to overcome. Funny thing about the 5888UV is the inconsistency in complaints. I have two radios, one early, one later production. The latest firmware update cover several issues. I don't have intermod issues with either radio. I've had both radios on the bench under a General Dynamics 8000 monitor. I won't BS, the early production radio fails several of my check points as a amateur radio. But passes as a LMR which is what the radio is but priced much less than traditional LMR.

I guess my synopsis is if you want something that doesn't have as many operational glitches, spend a couple hundred more bucks and buy a dual band ham radio. I'll keep both my radios. They function well for the tasks I have at hand.

Milton, list owner.

I am only reflecting what I have, and purchased the radio more out of curiosity and compromise hoping that it was a LMR. Was not bought for ham radio.
So it appears there are some models that are fine and some that are total crap. Many of the main stream ham radios stop TX at 470.00. Useless for my purposes and please don't rap on about FCC rules as they do not apply where I live, I have access to a few commercial repeaters.

So those planning to buy one now, I can only suggest they make sure it is the latest release including firmware.

1722. Re: Model type is Wrong. Overwrite?

Yahoo group: Anytone_AT-588UV
Date: 2013-05-21 01:03:16 UTC
From: kj4zfo
Topic: 1687 Message: 1722

Hello All,

Just to keep everyone in the loop, I did contact the seller who sent me to this group. They are an Amazon vendor that suggested I delete all software and retry Chirp. I did delete the software as well as clean out the registry of any reference to 588, 5888UV or Anytone. Correct me if I'm wrong but the basic issue is that someone must have changed the firmware and renamed the radio. When I start the QPS software, including the version recommended by Garrett, the software in the upper left corner says QX588UV, under the model information which is grayed out and cannot be changed says QX5888UV. Chirp won't touch the radio and comes back with an incompatible firmware error. the only error message I get is the one where I get a pop-up window when I try to download from the radio using QPS that says;

> Model type is wrong. Overwrite?
>
> PC is QX588UV
> Radio is AT588UV

It does not allow me to overwrite, I have an ok that closes out the process. I'm guessing that this radio ID's itself as an AT588UV and the software is looking for QX5888UV which calls the error and stops the read. Are there any magic button pressing combinations where I can change the name of the radio or is there some top secret software that allows me to do this?
I thank all of you for the many responses for trying to resolve this issue. I was hoping to find another person with the same issue but since I've not done so I'm wondering if this is a unit that should go back. It appears to work in every way except for the software, I'm hoping that one last plea might find that answer.

Thank you all again for your help
73's to you all.

Sal

Topic: 1687 Message: 1723

Ok. My final reply and as I close this thread forever is that QPS588UV version 1.00 copyright 2012 - 2013 will read my early and later production 588 radios. It reports both radios as QX588UV and the download file from the radio as new.dat.

Chirp doesn't divulge any radio info but works with both radios.

I have no other suggestions for you and since we haven't given you
an answer that will remedy your inability to use QSP or Chirp I think
you are better off pressing the Chirp programmers for a solution.
Hope you find a solution, Milton.

Subject: [Anytone_AT-588UV] Re: Model type is Wrong. Overwrite?

Hello All,

Just to keep everyone in the loop, I did contact the seller who sent me to this group. They are an Amazon vendor that suggested I delete all software and retry Chirp. I did delete the software as well as clean out the registry of any reference to 588, 5888UV or Anytone. Correct me if I'm wrong but the basic issue is that someone must have changed the firmware and renamed the radio. When I start the QPS software, including the version recommended by Garrett, the software in the upper left corner says QX588UV, under the model information which is grayed out and cannot be changed says QX5888UV. Chirp won't touch the radio and comes back with an incompatible firmware error. the only error message I get is the one where I get a pop-up window when I try to download from the radio using QPS that says;

> Model type is wrong. Overwrite?
>
> PC is QX588UV
> Radio is AT588UV

It does not allow me to overwrite, I have an ok that closes out the process. I'm guessing that this radio ID's itself as an AT588UV and the software is looking for QX5888UV which calls the error and stops the read. Are there any magic button pressing combinations where I can change the name of the radio or is there some top secret software that allows me to do this?
I thank all of you for the many responses for trying to resolve this issue. I was hoping to find another person with the same issue but since I've not done so I'm wondering if this is a unit that should go back. It appears to work in every way except for the software, I'm hoping that one last plea might find that answer.

Thank you all again for your help
73's to you all.

Sal

I live in a VERY RF rich environment..St Louis MO.drive through there daily for work

Was having the same intermod UNTIL I turned RF SQL "off".which is not the way it comes from the factory

Using a dual band gain antenna..got my radio back in Jan/Feb

I use my radio in conjunction with the St Louis American Red Cross responding to Fires in the county. Works great in monitoring/communicating City/County Fire

Considering a second radio for "base" in the home office.

Subject: Re: [Anytone_AT-588UV] Re: High pitch whine on received audio?

I am only reflecting what I have, and purchased the radio more out of curiosity and compromise hoping that it was a LMR. Was not bought for ham radio.

So it appears there are some models that are fine and some that are total crap. Many of the main stream ham radios stop TX at 470.00. Useless for my purposes and please don't rap on about FCC rules as they do not apply where I live, I have access to a few commercial repeaters.

So those planning to buy one now, I can only suggest they make sure it is the latest release including firmware.

I agree the AT-588(8)vu is a terrible when used in a mobile situation.
Inter-mod is the one thing that really sucks with this radio.

However my TX reports have been really positive, and the audio is clear and
loud enough even with one window open. But there is this noise on the UHF
side.

Will be letting this one go, I feel the Wouxun is a better radio, but the
menu system takes some getting used to.

Anytone so far has failed and would advise people to steer clear of this one
until the inter-mod issues are sorted.

I live in Northern Idaho which is NOT a particularly rich RF environment. I'd read about the intermod issues and that turning RF squelch to OFF helped. When I got my radio a couple weeks ago that was one of the things I did when first programming it.

I've had no issues with the radio, at all. It works just fine. Both RX and (from what I've been told) TX are quite clear on both the repeater and simplex. General static and noise from the repeater are no different than my old Yaesu that this radio replaced.

Is it just that I got a "good" radio? Is it that I turned off RX squelch? Is it because I live in relatively quiet area? Something else? Beats me.

All I know is that I'm delighted with the radio and plan to get a couple more as soon as finances allow and replace my other two single band 2-meter rigs.

The AT-5888UV is one of the more sensitive radios I have to intermod. Driving in and around Seattle (very high RF levels), it is not uncommon to experience intermod. I can tighten the squelch enough to overcome the noise bursts. But compared with some other dual band wide-receive amateur radios, and with any commercial radio I have, the 5888UV is more sensitive to intermod than the others.

That doesn't necessarily mean it is a bad radio. It is about what I would expect from a low cost radio with a wide receive tuning range. Where I mostly need the radio for low signal reception (and not having intermod effect it), is out of the city where the surrounding rf level is nowhere as intense. It has it's place, but if you expect commercial land-mobile level of quality, this is not the radio to get.

If you use a gain antenna for mobile it adds to the intermod. A unity gain antenna is best for mobile if your environment is saturated with business frequency VHF and UHF transmitters/repeaters. I'm lucky around here. No pagers and all the business seems to be LTR, EDACS, Smartzone II trunked on 400 and 800. The radio is uber sensitive also as far as receiver gain able to pull test tone down to -175 dBm. My General Dynamics R8000 only goes as far as -180 dBm. So that's part of the puzzle. Now add maybe lower quality filtering devices in the injection points into the IF and IF filtering also could mean some radios got better parts than others. This is pure speculation regarding the quality of devices used but if you look at it from a stand point of trying to keep the cost down it makes a little sense.

1733. password protecting the AT-5888UV

Yahoo group: Anytone_AT-588UV
Date: 2013-05-23 13:57:29 UTC
From: sailorgriz
Topic: 1733 Message: 1733

This may have been discussed already. If so, I apologize and would appreciate a pointer to the discussion.

In the manual it talks about turning on the password protection but it says the password has to have been previously set. It doesn't talk about how to set the password--at least, I didn't see anything about it.

How does one set the password? And, once set and the protection is turned on, what does it protect? Does it make the radio non-functional until the password is entered? Or does it lock out menu functions and/or other specific items?

Thanks!

1734. Re: password protecting the AT-5888UV

It is enabled via computer programming. I have not actually tried using the password, so cannot tell you what it actually does. I will speculate it prevents the radio from being used at all.

You can enable a password using the QPS software. I have not needed to use it but would give it a try if you didn't want to be the first LOL. I imagine you would need to enter your password on the DTMF mic pad before the radio could be used for both rx and tx.

Thanks, Milton. I don't mind being first but I'll have to find a different computer. I don't have enough lines on my screen to run the QPS software. Sigh. Have the same problem with the Baofeng software for my UV-5R. Chirp, however, works fine. Except Chirp doesn't include all the additional programming features. Sigh.

The hazards of getting a very small netbook!

I tried the password feature via Program, Password and it had no effect I could find.
If you want to lock the radio at turn on, go to Function Setup, Use Boot-Strap Password, and a password entry appears. Suggest you only use numbers , *, or # because you must use the mic to enter the password. When you turn on the radio, CODE appears and it waits for the Boot-Strap password to be entered. Useful if you are concerned about unauthorized access to the radio.

That makes sense if you understand what a bootstrap is. It's basically does nothing but wait for the code before the firmware boots the radio up into normal operation.

I wonder if the radio will still program via software while waiting for a code? That might be valuable to know if by chance you entered something in the password code you couldn't enter on the DTMF pad.

And I wonder if the revive software could be used to reset a boot-strap password. I'm wondering all this because I'm not around my radio and Windows PC right now.

Hey did you try the set menu item #56 and turn PASSWD on when you tried just the regular password setup in the software? Maybe that's why it didn't work.

And it's good to know if you screw a bootstrap password that it isn't the end of the world. And it also means the radio has booted up by the time CODE appears which makes me wonder why they named it that way. Maybe just a translation issue.

Ok so you are saying setting the radio #56 to on and programming
a regular password in software results in the radio functioning
normally as if no password had been set. Oh well that's no surprise
as to something else that was overlooked.

Hello,

Just got this radio in Dayton hamfest. I'd like to wire it to use it for IRLP, echolink and aprs, and all I need is to find where to get a good source of COS from inside the radio.

Anyone find this info? Thanks

Thank you for your purchase Ramon, I have asked Anytone and hope for an answer soon that I can share.

Yes, and is used to tell a repeater a signal is present on the receiver so the signal is retransmitted thru a transmitter.

There is either a voltage present (+5v) or ground when this occurs, and somewhere inside the radio this could be obtained from an audio amplifier circuit.

A cheaper way is to get the green light that is lit when squelch is open, but this light is on the microphone and does not follow the PL tone necessarily.

I see. Well good luck. A switch would have to be hand made. On a Yaesu FT8900 the data port has one pin that is switched high and low. It is for an APRS unit or other equipment requiring that signal. I guess it's a real fast way to tell the external unit data is coming
in. Looking at the FT8900 schematic and block diagram, there is a huge matrix of high and low bandpass filters, comparators, etc.. And the start of the signal comes from a chip Yaesu calls IF IC. Must be one that does everything because it has an FM out. And that feeds this labyrinth of filters switches and eventually provides both 1200 and 9600 baud outputs plus the packet control voltage. Good luck finding that point where you could build a packet switch or even just a 9600 baud out which I think APRS requires. I know if you wanted to run PSK 31 you need 9600 but maybe 1200 will do for APRS and IRLP.

Understand 100% and just went all through this on a Yaseu that has that voltage on its data port. Unfortunately I couldn't even begin to guid you where to start with the Anytone radio since there is no technical literature, flow chart, block diagram schematic. And you would have to build this "packet switch" you would just need to find out what part in the audio filtering, switching, comparing etc.. to get signal from where you could build an open collector NPN circuit or open gate FET.

Yep you get the idea. I have done this on the Baofend HT radios for IRLP and would like to do it on this radio as an option. Last night I was looking inside the radio, but without a schematic, I couldn't really begin to figure out where to start looking. Plus when you take the lid off I see the solder side of the main board, not the component side.

From: n7kuw
Topic: 1733 Message: 1757

I just tested my radio, and password protection works. In the programming software you go to the function setup menu, then click to put a checkmark in the "Use Boot-Strap PassWord" box, which will then open another box where you enter your password. Once you write the radio, it will prompt you for the password before you it will restart after programming, and it will prompt you for the password any time you power off and back on.

Note that my radio is set to channel mode and "Lock" to disable VFO (required configuration for Part 90 use). That might (or might not) have an effect on whether the password function works or not, I don't know.

Once you have enabled the password via software, you can turn the use of it on and off through the function 56 menu option (but you have to use the password to turn the radio on to be able to get to that function if it is turned on).

Ok so #56 has to be on for bootstrap password to work. In the software
and I haven't looked at it for several days, there is supposed to be another
password that doesn't work. I guess I'll have to look at it tonight sometime
and play around. Right now I'm having fun setting the old radio up for crossband.
It worked ok but you had to wait until the 3 second repeater tail dropped before
what you were transmitting would be heard. Kind of like a busy lockout but the transmit
still functioned. I found out if you use tone encode and decode on everything that you
can then interrupt the repeater tail. Funny that the repeater only generates tone
when the receiver is active. This way you also hear no repeater tail or ID. Just
what is coming in the repeater's receiver. And you don't have to use tone encode
to access the repeater it just transmits its own when receiving any signal and stops
when the incoming signal stops. There must be a reason, maybe for those who don't
wish to hear the repeater ID and the tail? But anyway, thanks for the info on the password
I'm sure some out there as I will appreciated it.

I just tested my radio, and password protection works. In the programming software you go
to the function setup menu, then click to put a checkmark in the "Use Boot-Strap PassWord"
box, which will then open another box where you enter your password. Once you write the
radio, it will prompt you for the password before you it will restart after programming,
and it will prompt you for the password any time you power off and back on.

Note that my radio is set to channel mode and "Lock" to disable VFO (required configuration
for Part 90 use). That might (or might not) have an effect on whether the password function
works or not, I don't know.

Once you have enabled the password via software, you can turn the use of it on and off
through the function 56 menu option (but you have to use the password to turn the radio on
to be able to get to that function if it is turned on).

Is this password protection an anti-theft feature? Reminds me of password codes in most modern car radios, but i see no use for this.

Also what is the video out in the back of the radio? I saw it but gave it no thought until now. Maybe its been discussed and I need to dig thru old messages.

The Usb on the side is also initially useless but now I do have a very good use, to power a Raspberry Pi computer and use IRLP/EchoIrlp and maybe Aprs.

Right, jwheatly confirmed that. That's a safeguard incase you
input a character into the password code you can't recreate using the
DTMF pad. At least that's what I think. Now stun and kill is a little
different since you have to use the revive software which a few have
but unless you can confirm you are a dealer.

Topic: 1733 Message: 1762

Yes the bootstrap password is there for unauthorized use. And maybe as a theft deterrent. But it can be disabled vis available QPSAT588UV programming software as while the radio is awaiting the password you can read and write to the radio. This I think is so that if you enter a letter into the password, it of course can't be made on a DTMF pad. So this way you're aren't SOL. The stun/kill software and setting up 5Tone is the real way to disable the radio by toning it if it is stolen. It's a brick until it's revived by software not readily available to the public and can't be had from the manufacturer unless you can convince them you are a dealer or work with a dealer.

Forget about the video out stuff I don't remember what it was for and it along with TV audio reception functions seemed to have been overlooked.

The USB jack is a 5 volt 500 milliamp source for charging your electronic smart devices like smartphones and tablets which most today use that voltage. I use it because I used to own a thing that plugged into the cigarette lighter jack but it stopped working, Now I just plug it into the radio head.

Is this password protection an anti-theft feature? Reminds me of password codes in most modern car radios, but i see no use for this.

Also what is the video out in the back of the radio? I saw it but gave it no thought until now. Maybe its been discussed and I need to dig thru old messages.

The Usb on the side is also initially useless but now I do have a very good use, to power a Raspberry Pi computer and use IRLP/EchoIrlp and maybe Aprs.

1763. IS RADIO NOT DATA CAPABILE?

Yahoo group: Anytone_AT-588UV
Date: 2013-05-24 21:53:43 UTC
From: BILL
Topic: 1763 Message: 1763

I have not heard anyone discuss any data capabilities of this radio. Is it capable of sending and receiving PSK or any of the digital modes?

If not, this is a significant drawback to purchasing this radio. I was hoping that the USB port on the side of the radio would be a data port or you could replace the microphone and have the ability to using the mike port as a data in data out connector.
WOW! a modern radio without data capabilities! Someone missed the boat.

Nope. In efforts tot keep costs down the radio omitted those
things. Also maybe have been omitted because the radios
that were bought that were to be used as LMR there would be
no need. So if you are looking for that stuff my suggestion would be
the Kenwood DM-710 which has a built in 1200/9600 baud TNC
and is ready for ARPS, KSS II and a buch of other modes.

Price is around $600 US for the radio, twice as much as the Anytone.

Define the use of the word 'we'. Are you referring to a licensed radio dealer? Didn't think that just regular licensed Hams could do that legally without voiding part 90.

I work on them under a commercial license And it does
nothing to the certification.

Somebody please correct me if I'm wrong but doesn't opening the case on a radio that's FCC Part 90 certified void the Part 90 certification?

On 5/24/2013 2:43 PM, KP4TR (Ramon Gonzalez) wrote:

Yep you get the idea. I have done this on the Baofend HT radios for IRLP and would like to do it on this radio as an option. Last night I was looking inside the radio, but without a schematic, I couldn't really begin to figure out where to start looking. Plus when you take the lid off I see the solder side of the main board, not the component side.

Topic: 1743 Message: 1770

If you have or work under a commercial license
covering LMR then yes you can work on it legally.
I've worked on LMR gear that was worked prior
by unlicensed but the radio retained its certification
once it left my hand and passed all the specification
for proper operation. I'll have to ask the owner next
time I hear him on the air. I don't have to know it all
just do what I'm told and let him worry about his license
because he is ultimately responsible.

Define the use of the word 'we'. Are you referring to a licensed radio
dealer? Didn't think that just regular licensed Hams could do that
legally without voiding part 90.

I don't want to get into a wizzing contest with you, but we is me and my boss. We maintain some 12 repeaters and 275 HTs and mobiles in a commercial environment. In addition, we are Hams and active in the local club.

Subject: Re: [Anytone_AT-588UV] Re: Where to get COS in radio

I work on them under a commercial license And it does
nothing to the certification.

Somebody please correct me if I'm wrong but doesn't opening the case on a radio that's FCC Part 90 certified void the Part 90 certification?

On 5/24/2013 2:43 PM, KP4TR (Ramon Gonzalez) wrote:
Yep you get the idea. I have done this on the Baofend HT radios for IRLP and would like to do it on this radio as an option. Last night I was looking inside the radio, but without a schematic, I couldn't really begin to figure out where to start looking. Plus when you take the lid off I see the solder side of the main board, not the component side.

Yes, and is used to tell a repeater a signal is present on the receiver so the signal is retransmitted thru a transmitter.

There is either a voltage present (+5v) or ground when this occurs, and somewhere inside the radio this could be obtained from an audio amplifier circuit.

A cheaper way is to get the green light that is lit when squelch is open, but this light is on the microphone and does not follow the PL tone necessarily.

The ID is T4K-5888UV

https://apps.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Sum&calledFromFrame=N&RequestTimeout=500&application_id=421975&fcc_id=T4K-5888UV

Just FYI: The ID doesn't show up if you type in a search for 'AnyTone'.
The FCC search works perfectly if you use, 'Qixiang Electron Science&
Technology Co., Ltd'.

This radio does digital of any type just fine as long as you make a data cable to plug into the microphone connector. All the digital modes are audio transmitted and while it will probably not do 9600 baud packet it does do 1200 baud and all the sound card modes.

If you are using it as an amateur radio operator the Part 90 certification has no meaning--
it is certification for commercial or public safety use only.

You can repair a Part 90 radio, and it retains certification. But if you modify it, then the certification is invalidated (regardless of what type of operating or technical license you hold) until it is resubmitted for certification with the modification. If you need COR out of a Part 90 Land Mobile radio, then you need to buy one that provides that (many do).

However, if you are using the radio in the amateur service, then the Part 90 certification is not applicable, and you can modify the radio so long as when you are done, it continues to meet the technical specifications for the amateur radio service. You as the amateur license holder are responsible for that.

The ID is T4K-5888UV

https://apps.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Sum&calledFromFrame=N&RequestTimeout=500&application_id=421975&fcc_id=T4K-5888UV

Just FYI: The ID doesn't show up if you type in a search for 'AnyTone'.
The FCC search works perfectly if you use, 'Qixiang Electron Science&
Technology Co., Ltd'.

Simple, remember the topics you consider stupid dribble and don't click on them. Or unsubscribe
if it bothers you to read US FCC discussion.

This is really getting stupid! There are some of us that has to read through some of this dribble regarding FCC regulations which does not apply to the rest of the world. Can we just keep discussions to the radio itself and let the ham band police take a hike up where the sun don't shine. You know there are some us on this forum who really don't require FCC education.

I thought the need for any FCC comercial license went away years ago for most things unless it had to do with ships or maybe airplanes.

I had a First Class Radiotelephone about 40 years ago but never put it to use, so let it lapse when they went to that General license.

The PG or General is part of a group of 14 individuals under the Commercial license class. Commercial is just a generalization for advertisement. Fits better on the business card then
Genreal Radiotelephone Operator's License.

Jeez you guys are really making a big deal out of this.
I think it's time to close this topic, anyone else replying

All I want to know is where I can get COS signal, and a discussion has brewed because I took the lid off?

The only thing opening the lid may get me is voiding my warranty, if it has one since I don't see any warranty information anywhere in the box, and the gentleman who sold me the radio was going to email me my receipt and I never got it.

As soon as I find this information out (COS) I'll take pictures of it and post it in the files/photo section for others to see and learn. I don't worry if FCC part 90 certification is being voided, I'm only concerned with part 97. I'll let someone else do the worrying for me!

Otherwise I won't do a thing to it and use it in my car when I travel to Puerto Rico in the summer.

73!

Very well put. If you had responded first maybe this simple question about the legalities of modifying the 5888uv radio wouldn't have gotten so far out of hand.

Subject: Re: [Anytone_AT-588UV] Re: Where to get COS in radio

All I want to know is where I can get COS signal, and a discussion has brewed because I took the lid off?

The only thing opening the lid may get me is voiding my warranty, if it has one since I don't see any warranty information anywhere in the box, and the gentleman who sold me the radio was going to email me my receipt and I never got it.

As soon as I find this information out (COS) I'll take pictures of it and post it in the files/photo section for others to see and learn. I don't worry if FCC part 90 certification is being voided, I'm only concerned with part 97. I'll let someone else do the worrying for me!

Otherwise I won't do a thing to it and use it in my car when I travel to Puerto Rico in the summer.

[snip]

There are actually several reasons for a repeater to be set up the
way you are describing (with output tone on only when an input signal
is active) and you actually determined its usefulness very quickly.

You can certainly utilize decode of the repeater's transmit PL to
stop hearing the repeater ID and tail. But more importantly, it can
be used for the other reason you mentioned, and that is not having to
wait for the repeater output tail to drop before you can start
transmitting to it crossband. If more repeater owners were to
configure their repeaters this way, it would make crossband operation
through them much easier and more efficient.

Hi all once more
is there anybody who doesnt have this tone problem, its not according to the antenna or somthing else, I did it on a dummy load with some uW from a trx below S3 signal, its nearly impossible to read the other station in VHF and UHF, if signal it stronger and volume in the first quarter the tone is overlaying the signal significant.
tnx

just curious guys, does this whine occur with all frequencies on the radio?
And no, I don't mean just VHF and UHF, but specifically, does it happen across the entire receive range of the radio on both VHF and UHF bands?
It sounds so much like an RXO whine that I wonder if it only effects the ham bands because they are getting to the edge of the rxo tolerance...but I'm obviously wrong if this whine happens absolutely everywhere.

My radio makes it on the UHF side. You can get rid of it without affecting the basic audio by purchasing an external speaker. They are for the most part limited to 3khz of response and the whine lives above that. You might also experiment by placing a non-polar electrolytic cap across the speaker terminals. Would that not make a tuned circuit between the voice coil and the cap? Always said I was going to play around with that but never got to it.

The print screen is the control key and print screen for all the current screen, or ALt key and print screen for just the current window.

The paste is control and the V key.

works great.

yes, a small cap will act as a low pass filter, IE attenuate the highs.
You have to play around with values to find the right band pass, but I think 0.1MF and lower in value will be a good starting place.
you can of course go online and find cross over calculators which will allow you to enter a frequency such as 3500HZ and it'll tell you what size of cap to use.

I've built some speakers and crossovers, repaired some stage monitors and main speakers. So that gave me the idea to just use the cap along with the voice coil for a low pass filter. Like it's done on a passive crossover.

What you are describing is a microphonic receiver. Does the problem go away when you turn cc down the volume? If so the receiver vco is is picking up emf from the internal speaker. This is usualy caused bo poor vco shielding.

Use of an external speaker is the easest fix.

Not it's not microphonic. It exists with the volume at zero.

What you are describing is a microphonic receiver. Does the problem go away when you turn cc down the volume? If so the receiver vco is is picking up emf from the internal speaker. This is usualy caused bo poor vco shielding.

Use of an external speaker is the easest fix.

My radio makes it on the UHF side. You can get rid of it without affecting the basic audio by purchasing an external speaker. They are for the most part limited to 3khz of response and the whine lives above that. You might also experiment by placing a non-polar electrolytic cap across the speaker terminals. Would that not make a tuned circuit between the voice coil and the cap? Always said I was going to play around with that but never got to it.

just curious guys, does this whine occur with all
frequencies on the radio?
And no, I don't mean just VHF and UHF, but
specifically, does it happen across the entire receive range of the radio on
both VHF and UHF bands?
It sounds so much like an RXO whine that I wonder
if it only effects the ham bands because they are getting to the edge of the rxo

tolerance...but I'm obviously wrong if this whine happens absolutely
everywhere.

exactly.
and, in this kind of application, you only need a small cap because your only dealing with 4 watts or so of maximum power.
what's that, something like 6 volts or something? I can't remember the conversion.

I've built some speakers and crossovers, repaired some stage monitors and main speakers. So that gave me the idea to just use the cap along with the voice coil for a low pass filter. Like it's done on a passive crossover.

□
yes, a small cap will act as a low pass filter, IE attenuate the highs.
You have to play around with values to find the right band pass, but I think 0.1MF and lower in value will be a good starting place.
you can of course go online and find cross over calculators which will allow you to enter a frequency such as 3500HZ and it'll tell you what size of cap to use.

From: Todd Bloomingdale
Topic: 1802 Message: 1802

Hello all.

well today, I got the approval from my other half to purchase a 588UV
for $288.98
through Advanced Specialties INC. through their amazon store.

I also purchased the Comet CA-2x4SR-NMO BROADBAND VHF/UHF Dual Band antenna
for $56.75 through Cheapham.com since I will be using this radio on amateur
radio vhf/uhf, and also on our county emergency services channels annd also
excellent reviews on several sites, including eham reviews.

Both places have shipped and also sent tracking numbers same day, so
hopefully it will be in my hands by the end of the week.

I suppose you could power your phone or charge it if it didn't require 500 ma. I was using a USB powered fan to sit atop the radio while testing its tx into a dummy load. It consists of two 40 mm fans in a piece of plastic and its real use is a laptop cooler as it has 4 fold out legs. It also has a couple blue LEDs on it. I plugged that into the radio's USB port and the led's seemed to blink a bit and weren't as bright as when plugged into my laptop. So this leads me to think that port on the radio doesn't have much current. I plugged my Samsung Galaxy Nexus phone, 3400 mah battery into it and it seemed to charge ok. It may be just this particular radio. I have another out in the truck I should try. 500 ma isn't a lot to ask for.

And one thing I've noticed after testing this radio that has a very low serial number, one of 50 first imports, that the tx power on UHF drop when the radio gets hot. Almost in half. I don't know if that is intentional design or not. But the dummy load was 100 watt continuos and the SWR meter said 1:1. Cooling the top while still transmitting brought the power back up. I was interrupted so I didn't get to the VHF test. But I had the UHF section keyed up for an hour continuos and no smoke of flames. I need to find another 120 mm 12 volt fan to sit atop it. I had one and it stopped working. The little built in fan is woefully insufficient for cross band repeating at high power and I'm sure the radio would either burn up or shut down if it got hot enough. But just with a 120 mm fan laying on top it seemed to stay nice and cool, not lose any power on UHF. Don't know why I went off on this tangent, maybe a caffeine buzz?

Yeah that would be way too cool. But you know what?
It's pretty easy to do it with the clone cable but you still
need the damn source radio. Darn those Anytone engineers
to give use a virtually worthless USB port. But you gotta
consider the source. China. What do they have a trillion
cell phones over there? And one more point. This is a LMR
and I cannot stress that enough. The design was to impede
or downright prohibit easy field programming or cloning.
Must be some Part 90 FCC thingy I don't know. But traditionally
LMR was not field programable. I started out working on
Motorola LMR like the Syntor, Spectra etc... You had to
program PROMS, EPROMS with their equipment and DOS
software on an old slow Pentium. Sometimes even with their
stuff you could brick a PROM. Toss it in the trash heheheh.
Get a fresh one out of the parts bay and try again. So life
is not equal to amateur radio certified equipment although
I haven't seen any amateur stuff with a USB port on it.

Milton,

Is the anytone rainproof like the mike and remote face? I ask do to i like to install it on a boat since it covers marine and gmrs frequencies.

Thanks,
Joe

It is not waterproof (or even water resistant). The radio is also not certificated (i.e. legal/authorized) for either marine (Part 80) or GMRS (Part 95) use, only land mobile (part 90).

You can RX GMRS and Marine but not TX with the 5888UV.
Well that is unless you were on fire or sinking then you might
not get nailed if the FCC found out what you used to signal for
distress or mayday if it was the only thing available.

And I doubt if the remote head or mic are anything near water resistant.
I had a control head apart to change the mic preamp board and it had no
signs of any waterproofing measures. The mic itself has a speaker in it
that would allow water to seep in in anything more than a few raindrops.

can definitely hear it in the second clip.
doesn't seem that loud though, more like a fan noise that many radios have. I know that isn't what it is, just comes out that way in relation to ambient noise.
An external speaker, or using a cap across the terminals of the speaker really is a pretty quick and easy fix and wouldn't degrade the audio at all.
they must test these radios in noisy environments during development because that whine could easily be vailed or washed out by any white noise in the listening area.

BTW, that is one hell of a curtesy tone on the repeater hahaha.

The noise does not increase as the volume is increased.
At least not on my radios. But with the volume low the
noise actually distorts the wanted audio. And you can still
hear the noise with the volume off. But A decent communications
speaker will filter it. And to me the noise out of my radio doesn't
sound like an analog whine. Definitely digital in origin. Serial data
bleed perhaps? But it doesn't compare to the noise from the mic speaker.
That is really inundated with data noise.

Any chance the cross band repeate function may be on? It sounds like a feedback loop to me...

The noise does not increase as the volume is increased.
At least not on my radios. But with the volume low the
noise actually distorts the wanted audio. And you can still
hear the noise with the volume off. But A decent communications
speaker will filter it. And to me the noise out of my radio doesn't
sound like an analog whine. Definitely digital in origin. Serial data
bleed perhaps? But it doesn't compare to the noise from the mic speaker.
That is really inundated with data noise.

can definitely hear it in the second
clip.
doesn't seem that loud though, more like a fan
noise that many radios have. I know that isn't what it is, just comes out
that way in relation to ambient noise.
An external speaker, or using a cap across the
terminals of the speaker really is a pretty quick and easy fix and wouldn't
degrade the audio at all.
they must test these radios in noisy environments
during development because that whine could easily be vailed or washed out by
any white noise in the listening area.

BTW, that is one hell of a curtesy tone on the
repeater hahaha.

No. It's a very digital sounding noise to me. I'll be at the radio shop next week, they haven't had any old gear to work on but think someone might be bringing in a GE Mastr II for a 420 - 470 split to use as a repeater. Lots of mods to the exciter and PA. I might get the chance to put the 5888UV on the R8000 and analyze the audio and see just what is riding along. I do have some schematics and block diagrams thanks to another list member so if I can track it down I might come up with a fix. As the shop owner says about the Chinese stuff, sh**y shielding inside. I read about a TYT 888 that had crappy audio on the speaker but an external was fine. Here the internal speaker wire wasn't soldered to the circuit board ground. Moving the wire to a land on the edge of the board cured the audio. So it may be something stupid like that. Don't know, it's hasn't been a priority of mine since I use a speaker that filters it out. However at a very low volume, it does distort the received audio a bit. I don't care for that much.

Now that's very odd. I know at least on my old radio you'd be lucky
to get 300 ma @ 5 volts. I plugged a USB laptop cooling stand into it so
the two 40 mm fans would cool the radio down when cross banding
during a thunderstorm on a very active emergency repeater. Two fans
and two blue leds. I noticed the leds pulsed so I unplugged it and found
a 120 mm 12 volt fan out of a computer case. When I plug the cooler into the
MacBook it works fine, no pulse and the leds are brighter. I'll have to try it
on the radio out in my truck. It's a lot newer, maybe they made some changes
but I doubt it. That radio makes a slight whine on UHF only even with the volume
at zero when the channel is active.

1823. Programming Software

Yahoo group: Anytone_AT-588UV
Date: 2013-06-02 01:17:18 UTC
From: w4jro
Topic: 1823 Message: 1823

I am having trouble with the anytone software. It wants to set the offset to the positive side on 145.250. I cannot find anyway to change it. Any help would be appreciated.

Topic: 1823 Message: 1824

When using the software there is no need for offset- just enter the Rx and Tx frequencies in the Normal Channel Edit Screen.

I just got my programming cable today and started working with the software this afternoon. Knowing that it is a LMR I quickly found a work around by adding .600 MHZ to (+ offset) frequency and subtracting .600 MHZ to (☐ offset) frequency. I hope this helps.

From: joe
Topic: 1826 Message: 1826

You can see a new video here,

http://www.youtube.com/watch?v=5UnO-Bnc_rQ
If you set in menu 23 squelsh off and than you listen to a strong station with constant signal (busy repeater);make a frequency change and after returning to the former frequency signal meter shows very low signal.
A feature or a bug ????

Can you reproduce this also with your equipment?
73 Alex

To me it sounds like you did not loose any signal strength, but rather the radio is just not showing visually what your true reading is. I would say a slight bug.

But you must remember that this is a LMR. A radio tech would program all the radios for a department and the end user operator would have no access or need to go off frequency, only to change from one channel to another.

All the best.

HI
yes you are right, signal strength is the same.
Curios is, if you set the same frequency in VFO A and VFO B, this error doesnt occur.....

Hi
it should prevent digital distorsion from internal clock, so you can change and avoid distorsion

Clockshift changes the frequency of the PLL clock if you receive a birdie on a certain frequency. Birdies are internally generated signals that sometimes occur on a frequency you want to use. I own a Baofeng F11 that has an S6 indicated birdie on the output of a repeater I like. When the repeater is active the birdie heterodynes with the repeater out making it virtually impossible to listen to.

I would say, don't do that. :) I imagine if you spend hours nitpicking with the radio you might discover a dozen bugs. I don't really try to find bugs with the radio myself but have stumbled upon a half a dozen just using it daily. One of the oddest is my newer radio makes a clicking sound when listening to public safety VHF channels around 155 MHZ if that side of the radio is the sub and not Main. And it's only when I'm moving. If I make that channel the Main the clicking goes away. This doesn't happen within the amateur limits nor does it happen anywhere in the UHF coverage. Don't know about 220 or 350, nothing around here to listen to. And it doesn't click in the aircraft band. Pretty odd huh?

hello all. need some help. I received the 888uv today. and thought Id get started on the programming of the radio. hooked up usb. cord drivers installed fine. Decided to try chirp software since im familiar with that software. after that I downloaded the anytone software qps588uv software fine. Tried to read from anytone software to radio. and Keep getting error message runtime error 8020. error reading software device. I thought this would be easy since working with the baofeng and wouxun radios. can someone please give me some help. My computer is a acer running on windows home.

thanks for the help.

Chirp doesn't rely on Microsoft Visual Basic 6 Runtime. It uses Python. This is a know issue with Microsoft and the serial port driver. Not much you can do except try another cable.

If it were the wrong radio type, that's the error you would get not a Visual Basic Error. As I understand Chirp is built using Python, not Visual Basic 6. Why you get a Visual Basic error, I don't understand unless the error comes from the driver being called to run or the way QPS588UV software calls the driver differently. I think you have the correct software version and there are some articles on Microsoft's site regarding error 8020, USB to serial drivers and Visual Basic. I'd suggest your do some Google data mining using the key words LPT driver 8020 runtime error. That should give you plenty of reading and suggestions on what to do. But again I think you have the right version of the software.

1842. AT-588UV Ques. Some Analog or fully Digital.

Yahoo group: Anytone_AT-588UV

From: Don Jeerings
Topic: 1842 Message: 1842

Not having any reason to open my Anytone AT-558UV radio, I ask the question of those that have...

Would you consider these radios to be truly in the SDR ("software driven radio) class? i.e. Did you observe very many (if any) analog components, such as inductors and tuning condensers etc. inside?

Externally, they appear to truly fit the SDR classifications, but I know not, of any American counterpart on the market in a competitive price range. This maybe why you will not see a schematic on them.

Has the foreign technology advanced that far ahead of us?

KI4EFL

I've had a problem like this before: on the cat-5 type receptacle on the radio take a magnifying glass and inspect the wire prongs in the receptacle that should be at a uniform angle to where they will engage the slotted metal contacts on the male cat-5 end of the USB programming cable.

I would call it soft potted. Obviously with two MPU's one inside the radio and one in the control head they server different functions. The MPU in the control head takes care of the display, what ever is in the Set menu, and probably the buttons and maybe even the volume and squelchs. All this is sent via serial data to the main unit. Now since a couple firmware upgrades have made better or outright fixed some operational problems with the receivers it kind of indicates that firmware does hold some fine tuning parameters for the receiver and possibly the transmitter. Newer Yaseu radios are soft potted. My FT60 and FT8900 both have service menues you can change values in but pushing buttons on the radio itself. These include alignment for both transmit and receive. So it's not too hard to think that the 588UV incorporates similar properties. I have some schematics of it I should take a look at more in depth. There may be some service literature describing alignment procedures. So I really wouldn't say it's an SDR. That conjures up visions of software on a PC controlling all the functions of the radio and giving a virtual control panel of the radio on screen.

Subject: [Anytone_AT-588UV] AT-588UV Ques. Some Analog or fully Digital.

Not having any reason to open my Anytone AT-558UV radio, I ask the question of those that have...

Would you consider these radios to be truly in the SDR ("software driven radio) class? i.e. Did you observe very many (if any) analog components, such as inductors and tuning condensers etc. inside?

Externally, they appear to truly fit the SDR classifications, but I know not, of any American counterpart on the market in a competitive price range. This maybe why you will not see a schematic on them.

Has the foreign technology advanced that far ahead of us?

1845. Tone Squelch - a "gotcha"

Yahoo group: Anytone_AT-588UV
Date: 2013-06-04 23:19:48 UTC
From: n7kuw
Topic: 1845 Message: 1845

I had programmed my 5888 to have a number of channels tone guarded (DCS squelch on receive). Using software, I programmed both a transmit DCS code and a receive DCS code. But in service I found it was not tone guarded on receive.

Digging a bit deeper, there is another setting you have to make to enable tone squelch (even though you program a tone squelch). In the software (Anytone software) double click the little right arrow (More)at the right side of the programming data and set the squelch mode to CTCSS/DCS. There is probably also a menu setting for this, but I don't know which menu item it is.

Posting just so someone else who wants/needs to run tone squelch doesn't get caught by surprise like I did. I just assumed if you programmed in a receive tone (CTCSS or DCS) the radio would use it. But nope, you have to program it in and set that channel to tone squelch mode. Should know by now not to make assumptions.

Yeah it's #16 SGN SQL. Press Set and rotate Main encoder knowb to menu item #16. Pressing the Main band encoder knob will take you to a function menu of 5 different squelch modes. Rotate the Main encoder knob
to your target mode. Press and hold for 1 second the Main encoder to save the selection then press Set to exit set mode.

Hello again gang. I have found a resolution to my USB cord communications problem of the error 8020 using the QSP software. after doing alot of research and found a fix on the baofeng help site. Seems the cord DOES NOT like the latest driver update. It stated to back up to 3.2.0.0 driver and that resolved it. Here is where I found it incase someone else comes along the 8020 error.

Glad you got it sorted. What you probably have is a cord with counterfeit Prolific chip. Prolific created the new driver so it would not work with a counterfeit. But I thought that the last driver that would work was 2.x.x.x. I've read a lot about it in the Baofeng group and the Chirp group.

1849. Charging phone with USB port.

Yahoo group: Anytone_AT-588UV
Date: 2013-06-05 20:57:59 UTC
From: Milton Hywatt
Topic: 1849 Message: 1849

Has anyone been able to charge a phone or even tried it?
I did today with my Samsung Galaxy Nexus android phone.
It's a big phone with large 4.6" screen and has a 3400 mah
battery. I plugged it into the USB port, the phone said
charging 77%. An hour later it still said charging but this
time it dropped to 75% LOL! Brought it in the house, plugged
it into the charges for my Google 7" Nexus Tablet and in 3
minutes the percent of charge jumped to 80. And this is with
the newer radio. I know the older radio I also own doesn't put
out decent voltage. Plugged a laptop cooling thing in with two
small fans and two blue leds. The leds were pulsing and not as
bright when hooked to a laptop or powered USB hub.

Yeah, Milt. I've tried it. Mind didn't work, either. I had it plugged in for a couple of hours while on a recent trip and the phone certainly didn't get any extra charge. Not sure if the charge went down, but it's possible.

Oh, well. I have other chargers I keep in the truck. Sigh.

Well maybe there is just enough juice there to dial 911 if you need to. But I swear my phone
went from 77% to 75% after an hour of being plugged into the port. I do keep a spare battery
in the console so it's not a big deal. And I have a 400 watt inverter that I could plug my wall
wort into to charge on the road if needed. This is pretty disappointing though and you would think
WTF Anytone? 5 volts at 500 ma isn't much to ask for. Are the developers smoking some Chinese

I checked Ed's website again today and there are still not available to order.

Does anybody know when they will be available again?

1855. Speakermic Audio Issue

Yahoo group: Anytone_AT-588UV
Date: 2013-06-10 00:51:57 UTC
From: kf5vh
Topic: 1855 Message: 1855

I have just enabled the SPEAKER in the microphone on my new AT5888UV. As soon as it is enabled the radio ties an unmuted audio amp to the speaker. So even though both receivers have no signal, the audio amp is hot and tied to the speaker. Why isn't the output energized only when a receiver has a signal?

Further, since the audio amp is running anything on the amp input is amplified and you hear it on the speaker. It appears as if turning any of the knobs causes some switching and you hear pops/clicks in the audio. It also seems some combination of UxU and VxV provides a higher level of clicks.

This would all not be a problem if the audio amp was powered down or the output otherwise muted.

Has anyone found a workaround? Any idea why it would be designed like this?

What you hear is serial data being sent to the main radio.
The control head is connected via a cable with only 8 possible
connections so every input from the front control head is encoded
and decoded in the main radio using serial data at perhaps 36 kbps.

Why this serial data is getting into the audio is anyone's guess. My
educated guess is poor filtering/shielding.

I had a different symptom with the speaker mic that could be related to some type of bleed over problem. As long as I was just monitoring, everything was fine. But when I'd transmit the mic would not unkey. A friend had to call me on the cell phone to tell me to unkey the mic. I had to power down the radio and, as soon as I powered back up, turn off the speaker mic to prevent it from happening.

Kind of bother, actually, as I'd like to be able to use the speaker in the mic when traveling--for those times when my noise diesel wants to drown out radio speaker. Oh, well. I've lived with it all these years. Guess I can continue to do so. Shrug.

The speaker mic wouldn't do you any good in a noisy diesel.
Get a external CB speaker, 10 - 15 watts. Mount it high. Back
in the good old days I did a lot of CB repair and setup for
drivers. I know what worked for them. And back then I'm sure
the tractors were much louder inside. Specially the old Autocars
and Diamond Reos.

Subject: [Anytone_AT-588UV] Re: Speakermic Audio Issue

I had a different symptom with the speaker mic that could be related to some type of bleed over problem. As long as I was just monitoring, everything was fine. But when I'd transmit the mic would not unkey. A friend had to call me on the cell phone to tell me to unkey the mic. I had to power down the radio and, as soon as I powered back up, turn off the speaker mic to prevent it from happening.

Kind of bother, actually, as I'd like to be able to use the speaker in the mic when traveling--for those times when my noise diesel wants to drown out radio speaker. Oh, well. I've lived with it all these years. Guess I can continue to do so. Shrug.

The audio amplifier also spits out a generous amount of noise, even when the volume is turned down to a minimum. On top of all this there's an annoying high pitched tone present when the squelch opens. My frequency counter, DSO, nor spectrum analyzer were able to isolate the frequency due to the reported noise and distortion. I eventually managed to pinpoint the frequency by tuning my function generator until both tones were zero beat. I ended up at 4000Hz, give or take a few Hz."

I just installed my front panel mount and kinda disappointed. I installed the mount on my top dash in a perfect location. but with the head mount, i can lock the up and down pivot, but none on the side to side and with the microphone hooked to the head, the side to side doesnt have enough support to handle the mic cord weight. anyone have a idea or mod to remedy this?

Find another location for the mic mount? I don't have the remote mount myself.
I mounted the head itself onto an old GPS suction cup using the escutcheon
off the radio body as a holder for the control head. A little silicon rubber cement
and it's as solid as a rock but can be separated later if needed and won't destroy the
plastic.

I thought about drilling & tapping a small hole through the pivoting
section on the back, and adding a set screw. However, I'm using the
radio on a desktop currently and don't have a need to mount the
microphone so my I'm not too concerned with the head movement. However,
I am disappointed the remote mount isn't sturdier. I may trash the
original and use light gauge 'L' brackets to anchor the mount to the
steering column or somewhere else in the vehicle.

Topic: 1875 Message: 1875

I've been asked to help a 5888UV owner who doesn't belong to this list.
He is trying to program public service frequencies and when trying to
upload he gets Frequency is Wrong.

I've never seen this come up in the group as a question but I know a couple
of you members know way more about QPS than I do since I don't use it.
I don't have any other information yet as to what band is is trying to program

If anyone has some ideas I'm all eyes.

Milt.

Some of these radios, I own one, the external speaker jack
is on the bottom not in the middle as it is supposed to be
according to the owner's manual. So place the speaker
plug in the bottom jack if you are trying it in the middle.
Or in the middle if you are trying the bottom. Look in the
owner's manual for a visual reference.

I'll ask if he minds to publicize the frequency when he
replies to my initial email. If he does mind I'll probably
get ahold of you privately if you don't mind. This is contingent
upon that I can't replicate the error on my system. I definitely need
some more info on this from the owner.

My guess is it is a narrowband frequency with either a 25 or 75 ending and the step is not set to 2.5 kHz. The radio will shift the frequency to the step setting. I have numerous programmed into mine with out issue.

Make sure that the step rate is set correctly (many NYC agencies are or will be switching to 6.25 khz). Also make sure that the frequency being entered is within the range for that VFO.

Well I did try both 3.5mm ports for audio. The middle has audio but at
travel speed in my truck the audio is quiet. Now I did try switching to
the other port and putting the radio freq to a noaa weather station and the
radio head is showing a busy channel but no audio comes out of that port.
Does any settings have to be on to use that other port? Thanks again..

Nope nothing needs to be set however, there is in the menu a setting for ext and int speakers but it should be
on the default setting of int if you are using an external speaker with a mono
3.5mm plug. If you look at the manual in the initial installation chapter 3 page 7 you will see the
radio upside down rear panel view top right corner. My radio uses the top jack which would be the bottom
jack with the radio in the normal upright rear view. I own two radios, one was the #39th off the assembly line.
Its audio jack is in fact as depicted in the manual. The newer radio #295 is opposite.

Think I might need to send this radio back to the dealer.. reset to int
speaker. Unplugged ext speaker and now no audio. Plug ext speaker back in..
low audio.. fustrating

greetings again.

After doing a lot of playing with settings and Milts recommendations of doing a factory reset, I was able to get the ext speaker A LOT louder and crisper.. sorta... He told me to reset radio, put in a busy channel freq such as a noaa weather channel and put the settings on the radio to internal speaker settings. The output sound was changed for me for the main band. but the sub band would still sound quiet and distorted as you described also. if I flip sides of main/sub the audio is still the same. crisp on the main, junk on the sub. Not sure what to do with this situation. kinda defeats my objective of dual receive to me.

Todd,

I had the same problem. The audio was good on both sides after I programed the radio from the PC. Look Closely at all the settings and options before you wright to the radio.

Good Luck!

Randy

Topic: 536 Message: 1891

It's not physical shielding. It's inadequate filtering of the
serial filtering from the audio section. But due to the poor
quality of the service literature I have, I couldn't come up
with a solution other than to filter it out at the end. One of these
days I'll play around with filtering it at the speaker with a
lowpass filter. That's just a non polar electrolytic cap across
the voice coil of the speaker to make an LC circuit to attenuate
the high frequencies without affecting the normal bandwidth of
voice. Both of the external communications speakers I own
do a wonderful job of getting rid of the noise so I haven't
really been too enthusiastic about coming up with other solutions.
The noise is worse in the speaker mic. You can definitely hear
input of controls being transmitted to the main body of the radio
over a serial connection. And I've noticed that on my two radios,
that the whine or noise is almost unheard on VHF while it is loud
on UHF. Again with the poor service literature I wasn't able to
see where this was being leaked into the audio path. And it doesn't
matter on the speaker mic, it's loud on VHF and UHF. So I have
no real answer, just a work around.

Milt,

Did you have a chance to track down the problem?
Is the any conclusion?
Regards,

1893. Entering RX frequencies using the mic

Yahoo group: Anytone_AT-588UV
Date: 2013-06-23 14:54:55 UTC
From: rainhardreynecke
Topic: 1893 Message: 1893

Hi,

The unit does not allow me to enter VFO frequencies outside of the TX frequencies (144-146 & 430-440Mhz) using the mic.
I have switched off the VFO Band Lockout as per the manual instructions but no luck?
When I use the software to program there is no problem entering RX frequencies outside of allowable TX frequencies (144-146 & 430-440Mhz)

Am I missing another setting somewhere?

Please advise
Rainhard

Are you using the left side of the radio as the Main band where you are trying
to enter frequencies? And on the sticker on the radio backside of the radio what frequency
ranges does it give?

From: Gabriel Carrasco
Topic: 1899 Message: 1899

good Afternoon

I have two problems with my 2 Anytone radios, one crossband not works when you try to make the return falls and makes noise and does not work is just noise esucha

there is a blockage to the crossband?

The second I came within the European limited range 144-146 and 430-440 mhz, open a way to release the American radio range?

I really am very disappointed in this radio, expecting better performance but personally I find many faults among other is the SQL that does not work I have to set it to 0 to be able to hear stations that come with poor signal

If anyone can help me, thank you very much

Contact the person you bought the radios from. #1 radio appears to have a problem with cross band. I have two radios and one is used almost exclusively for cross band and it works well.

#2 radio can be correct with the stun/kill revival software, you need to get that from the person you purchased the radio from. It will open the frequency range up to 136 - 147 and 420 to 510 or there abouts.

Good luck.

Thanks for your answer

good hard look at the issue of the warranty, send the new radio to the U.S. to try to resolve the issue for the crossband

and another radio if the crossband works perfect but I have the European range limitation I should do to try to release it???

YY5CMJ

Contact the person you bought the radios from. #1 radio appears to have a problem with cross band. I have two radios and one is used almost exclusively for cross band and it works well.

#2 radio can be correct with the stun/kill revival software, you need to get that from the person you purchased the radio from. It will open the frequency range up to 136 - 147 and 420 to 510 or there abouts.

Good luck.

good Afternoon

I have two problems with my 2 Anytone radios, one crossband not works when you try to make the return falls and makes noise and does not work is just noise esucha

there is a blockage to the crossband?

The second I came within the European limited range 144-146 and 430-440 mhz, open a way to release the American radio range?

I really am very disappointed in this radio, expecting better performance but personally I find many faults among other is the SQL that does not work I have to set it to 0 to be able to hear stations that come with poor signal

If anyone can help me, thank you very much

I have two Anytone and both work XBand. Also both have very good Rx sensitivity. To open American band, try Software, Model, Band 1.

He who works well is the one European range limitation

open any link to download the program to release it? I have the manufacturer's program but this does not let me do anything.

if any of you have this software it would help me a lot

Radio with Europe range limitation can be expanded by a special software program. Ask your radio seller for that software. The reseller is the only person that should provide you with this. I know of several radios that were expanded with the software. And if it was your intention to buy a radio with full coverage then the reseller/retailer was obliged to sell you what you wanted and should provide the expander software.

The radio limited to European band can be expanded with free software.
I cannot send you this software but your retailer should be able to email it.
It will expand the radio. The other radio with the cross band problem should
be dealt with by the one who you purchased it from as it is likely a warranty
issue. These radios are not expanded by hardware modifications like the
Yaesu radios. I own an FT8900 and did own an FT8100. Maybe there is another
group member out of the 600 or so that might have this expander software that
is willing to send it to you but I cannot as it also functions to revive a radio that
was stunned or killed remotely.

Thanks Milton,

I hope to get this free software to attempt the modification of bands, I have a lot of knowledge on this subject because it is my first time something like this happens.

The yaesu all is working well and all modifications are secillas and easy to get on the web, the issue is that there is little information about this radio in addition to all the problems that many know.

Yaesu not want to use for the project I have in mind because they are very costly radius compared to at5888uv Anytone is economic radius.

someone told me about that attempt a radius cloning American Range is open bands 136-174 and 400-480 MHz to whether this gives resuldado and solves the problem of opening the European range

Thank you Mr. Milton and Mr. Griffin
By providing the software and unlock instructions, and the radio is operating in American range and also fully released

I will try to follow invertigando with the other team that apparently has problems with internal duplexer does crossband.

I will see if this changes a little my understanding of this radio

A reminder many of the cheap USB Chargers cause noise on radios. A good idea NOT to use the USB Port.

I own two radios. The USB port on both radios does NOT
have enough current to charge my Samsung Galaxy smartphone.
I would not expect it to charge any HT or tablet device. So I see
no use for it except to power a USB LED light maybe.

Is there a service manual? Then we could trace the data pins of the USB port and see if it does any dara functions.

Mine won't run a laptop cooler with two small fans and two
blue led lights. The leds pulsate and the fans turn much slower
than if you plugged it into your laptop. Maximum current from the
computer's USB port is 500 ma @ 5 volts. It will power my Samsung
Galaxy Nexus 4.5" AMOLED screen Android phone but it won't charge
it. It stayed at 75% charge for over an hour. So obviously this is yet another
discrepancy from radio to radio or production run to production run.

Unlike many of you, I have waited for this radio to be released and the first few versions to be issued.

Now that this radio has been out and I've seen all of the issues with it, do you still feel it's a good deal and would you buy another one? I know it's a part 90 radio that just happens to cover the ham frequencies so I don't want to hear about that. I have been most interested in it since before it was released because it does both.

I'm sure many who follow this group and haven't bought one yet have the same question so input from those of you who own them would be appreciated. I'm trying to figure out if I really want to buy one or find an alternative which I know will be more expensive.

Thanks!

I have an AnyTone 588UV and a friend has a Wouxun 920. Both have a few warts and both work just fine. Both are good for XBand Repeat- I have a 588UV on a mountain site for police UHF access to a VHF network. If you need both Ham and Commercial, I don't know of an inexpensive option other than the 588UV or 920.

I have owned Yaseu, Alinco, Icom, Kenwood. All had their glitches.
So if you are looking for perfection, it doesn't exist. If you are looking
for an inexpensive usable dual band the 5888UV is a good choice.
If you want a radio with similar specs that might have a couple less
bugs the Yaseu FT8800 for $460 + shipping and tax if applicable
would be a good choice. This is a ham only radio tx-wise. I own the
FT8900 quad band. I like the radio except for the lack of volume
of the internal speaker. The 5888UV blows it away. The FT8900
sits in the shack, unused since I bought two 5888UV's.

1931. Re: Is it worth it?

Yahoo group: Anytone_AT-588UV
Date: 2013-06-27 03:58:09 UTC
From: n7kuw
Topic: 1922 Message: 1931

As a dual band amateur radio, the 5888 is okay. Mine is a little more sensitive to intermod than either a Kenwood TM-V71A or a Kenwood TM-D700, both of which I have done side by side comparisons with. The audio output of the 5888 is both lower volume and a tiny bit harsher - less bass more treble - than the Kenwoods. It is a very attractive radio for the price versus what it offers.

As a commercial radio, properly programmed (to disable VFO capability), it satisfies Part 90 requirements. However, it does not hold a candle to any commercial grade land mobile radio that I have (Kenwood, Icom, Motorola, Midland) as far as intermod, audio quality, etc. But none of those other brands are dual band radios, and all cost significantly more than the 5888.

In direct answer to your question, at this point in time I would not buy another one, but mainly because I don't need another one. For dual band, or cross-band operations outside of the ham bands, I prefer to use two single band land mobile radios properly interconnected. Much better receiver selectivity, better duty cycle in most cases (stands up to higher transmit time versus receive/standby), etc.

So it really depends on what you are looking for, and what you can afford. You can't beat the price, and you get a lot of functionality for that price. But when you buy a budget radio, don't expect the same performance/capability as a commercial product twice (or more) the price.

I bought mine from Universal Radio and don't have any complaints. I do like my ft-8800r better, but that's not to say the 5888 is a bad radio. I do wish they had put in a data connector like the FT-8800R for doing easypal without losing the mic, but I can't complain as the Anytone is like $200 cheaper than the 8800. I also own other manufactures like icom, alinco, tyt, other yaesu and for the money and the cross-band repeat functionality, you can't go wrong with the Anytone. I bought my th-9000 and baofeng units from Martyn at radio mart and have not had a problem with that vendor either. It all depends on your uses and preferences.

As stated in the read me file the archive was created using 7-Zip.
On a Windows 7 or newer machine the archive is understood natively.
On XP you need to install 7-Zip. http://www.7-zip.org/download.html

Subject: [Anytone_AT-588UV] Unzipping the Programming Software

I'm unable to download the programmer from the AnyTone website, and the software in the Files section won't unzip (unspecified error) on my Windows XP machine. Are there any other sources for the software, or ideas on kick-starting the extraction?

Thanks 73 Rick N6CY

Thank you for the additional guidance on obtaining 7-zip for my XP machine.
Ed Griffin also pointed out a May 7th message posting that should work in my configuration.

I'm off and running.

Appreciate the help.
73 Rick N6CY

Yes, I have the speakers. To be honest, they aren't much louder than the internal speaker. Also, you don't really need two unless you are using the TV output. And if you are, I found the volume on the VHF speaker goes down and at that point is about the same as the internal speaker. All just food for thought.

I own a couple CB speakers I bought back in 2004. One is called a boomer the other I don't recall. But both have 4" round speakers, 8 ohms and will handle 20 watts. They are still floating around out there. Here is one place that sells them
http://www.dubscbshop.com/catalog/item/8737856/9810295.htm

This is a very loud speaker that will eliminate the serial data noise problem that some of these radio have.

Hi,

I received my set recently, so far so good!!

I am just battling to get the unit to display the received DTMF codes from other radios.

I had a look in manaul but can't figure it out?

Can someone please point me in the right direction.

You can use the function to designate deSired channels with a priority setting then go to the mem scan that only scans priority channels.

An easy way to mark/unmark priority chls is to designate mic keys "A" as scan, "B" as toggle mark/unmark priority Chl shown as priority.

1949. External Speaker

Yahoo group: Anytone_AT-588UV
Date: 2013-07-02 17:55:18 UTC
From: jimbiram
Topic: 959 Message: 1949

I'm not an electronics guru, and noticed that the specs say to use an 8 ohms external speaker. I was digging around my garage and found a couple of Realistic speakers, but they are 4 ohms, not 8. What would be the difference in sound, and would they hurt the radio?

Thanks everyone...

Hard to predict the difference in sound. Usually a 4 ohm speaker on an 8 ohm amplifier will be louder. I've repaired a lot of professional solid state power amps for band PA systems. Some up to 2500 watts per channel into 2 ohms. All that stuff you can run 8 / 4 / 2 ohms. I think you'll be alright with 4 ohms. And if you have 2 four ohm speakers, use both in series.

Some cell phones need more than +5V on the voltage line of the USB, but also need certain voltages on the data lines. For instance, an iPhone 3GS will start charging and pull 1amp if USB pin 2 is ~2.8v and USB pin 3 is ~2.0v. You can also get an iPhone 3gs to start charging and only pull a 500mA charge rate if both data pins 2 and 3 are ~2.0v. I assume some android phones utilize a similar scheme. I know for a fact an iphone 3gs or above will not charge at all unless there are voltages on the data lines and I am pretty certain that the Anytone does not put out anything on the data lines of the USB connector.

no worries at all with using a 4ohm speaker on the 8ohm output. it may or may not be slightly louder than an 8 ohm speaker, and it'll sound very slightly different due to the way the 4 ohm speaker reacts to the output of the radio compared to an 8ohm speaker. anyway, it's totally ok to use it.
Those older realistic external speakers were always excellent sounding and nice and loud. I actually use one at home and one in the vehicle because they do the trick so nicely...and they're cheap as dirt at ham fests :)

regards
Colin

I bought a thingy you plug into the cig lighter. I have one lighter and one accessory in the front side by side but the lighter only works in one therefore the other is just for 12volts. Both stay on when the SUV is off. This thingy gives you 2 additional round holes for power and two USB ports. It charges my Android phone and tablet perfectly. Both have good size batteries. The phone I believe is 6800 mAh. The phone would stay charged plugged into the 5888UV but would not charge on or off. Maybe Anytone realized a problem and corrected it after my radios were built but I doubt it.

I have the old rectangle Realistic communications speaker
that matched one of their shortwave receivers. It's the SP-150.
The receiver is the DX-160. Bought both maybe 15 years ago
at a hamefest for $50. The receiver is boxed but I use the speaker
with my current HF rig. Something about that big oval speaker
that really works well for SSB.

no worries at all with using a 4ohm speaker on the
8ohm output. it may or may not be slightly louder than an 8 ohm speaker,
and it'll sound very slightly different due to the way the 4 ohm speaker reacts
to the output of the radio compared to an 8ohm speaker.
anyway, it's totally ok to use it.
Those older realistic external speakers were always
excellent sounding and nice and loud.
I actually use one at home and one in the vehicle
because they do the trick so nicely...and they're cheap as dirt at ham fests
:)

From: Milton Hywatt
Topic: 1958 Message: 1958

Anyone using chirp recognize this error "Invalid Value for this Field/list assignment index out of range"

Someone in the Chirp list is asking, I don't recognize the error. The user is downloading first from the radio. User says this happen when trying to enter a frequency.

From: kd0sml
Topic: 1959 Message: 1959

Hi all,
Can anyone tell me which pin on the Mic Connector carries speaker output to the mic? What would I need to do to use it with my Signalink USB?

Have seen this topic approached from several angles (USB Port capabilities, etc.) but never asked directly in this manner. I have my Signalink working, but one less connection (loose the speaker output cable connection) is always a good thing if I can make it work.

Thanks!!!
Ron Elliott

I use the Radio Shack (Optimus) as well. I have several pairs of the metal housed speakers and they sound excellent. However, I too have experienced problems with the external speaker jack on the radio. Instead of a mono plug to the speaker, I've used a stereo plug, and the issue goes away.

The mic wiring diagram is in the owner's manual on page 10. looking at the front.

Left to right:
1-GND 2-PTT 3-MIC IN 4-MIC GND

Just make sure it's oriented correctly by checking pin 7 for 5 volts.

I appreciate the answer but it doesn't deal with the question (at least looking at my manual). The diagram on page ten does not show where the speaker audio for the mic speaker comes from. ie.

Pin 1 GND
Pin 2 PTT
Pin 3 Mic
Pin 4 Mic Gnd
Pin 5 Up
Pin 6 Down
Pin 7 +5v
Pin 8 Key Pad Serial Data

However we know from hearing it that it's there (when selected from the menu). Question is still, where does it travel and can you filter for it....

I don't know how the speaker mic audio is handled and didn't realize
that was what you were asking. Just use the speaker output on the rear panel
and plug an external speaker into your Signalink to monitor.

In the Speaker in the Mic is Enabled from the menu selections. MIC RJ45 Pin 3 is RX audio on Receive and Tx Audio during PTT. Audio gating in handled by circuitry on the MIC PC Board. This audio is low level and can not drive a standard 8 ohm speaker so be careful what you connect to this point. A better option is to use the recorder output jack (Next to the Rear Speaker Jack).

Does any one know if Anytone has a Button Style mic hang up kit to convert the Hook type mic hanger?

Randy.

I also wanted a button back for my mic so I scrapped out a button off a old mic in the drawer and and luckly it fit just nice with the hanger both installed so can use it for either application.

1966. Interferience on Sub-Band in Memory Mode

Yahoo group: Anytone_AT-588UV
Date: 2013-07-07 12:18:25 UTC
From: kc2ldr
Topic: 1966 Message: 1966

In memory channel mode working as a mobile unit, the AT-5888UV picks up or creates interferience which is audible on the sub-band. If I change the sub-band to the main band the interference goes away on the new main band but then shows up on the new sub-band. The interference occurs the same regardless if the motor is running or not running.
I am wondering if there is some some sort of filter or menu setting that I am missing?

What kind of interference? On my newer radio the main band works well.
but make the main band the sub, and listen to a VHF frequency of at least
155 mhz and as soon as you start rolling you hear clicks. Make the VHF
channel of 155 mhz the main band and the clicks go away. Odd one huh?
Doesn't happen on any other band and it doesn't happen in the US ham
band from 140 to 148 mhz. Again odd. Obviously it is picking noise up
from the anti-lock braking system or some other device reporting motion
because that's the only time I hear the clicks, when rolling. And if I'm stationary
and rev the engine no clicks are heard. And these are slow clicks, not like
interference from an alternator or ignition although I do get that also. It's
not offensive but the clicking is.

Seems to be a different problem. Moving or still, any fx. I do not think this is RF because it immediately transfers to the new sub band when I switch and disappears on the new main. This happens parked with the motor off and when I am underway. It is full scale intermittent blasts of static which break a 15 level squelch setting.

I have a similar problem when using U-U, but the noise is just low level clicks. The noise follows the Sub band but only if U-U. No noise with U-V.

I wasn't suggesting it was the same problem just sharing. Are there any combinations of frequencies this occurs on or does it happen with all? And what happens when you shut the sub band display off? I know on my old radio made late 2012, if I use it mobile I operate it with the sub shut off. Just too much interference between the sub and main regardless of which side is what. The newer radio doesn't do that so I've been using it mobile and the old for base.

Works fine in Windows 7. What most people have problems with
are the drivers for your data cable. What problems are you having?

Subject: [Anytone_AT-588UV] Software Issue

Does anyone know how to get the anytone software to work on win 7 as I am told by little
bro that it need win xp is this true?
Thanks in advance

Hi all, De wa6dij, Castroville, CA (near Monterey) and I am new to the group. Just curious about what the difference is between the 588UV unit and the 5888UV unit?

Jim Tripp

One as an extra letter 8 in the name. One story from the Chinese goes that the radio with the 588UV name would be sold only in China. The 5888UV would be exported. I own one very early production run radio and one later production. The early radio has AT588UV printed on the radio's bezel, the later has nothing printed. Both have a tag on the box and on the rear of the radio identifying
them as AT5888UV. The FCC ID also lists them as AT5888UV.

So any logical conclusion must be there isn't any physical or electronic difference.

Thanks for your quick response. My little brother is about 1 week ahead of me with these radios. Danny got his radio 2 weeks ago and he could not get the driver to work on win 7 you were right about that. Danny decided to bring his old xp machine out of retirement and he got it working that way. I pick up my radio on Friday and I don't want to have to put win xp on my machine. (I don't own a copy of xp nor do I have the desire to install 2 operating systems. there must be a simple way around this problem. I am running win 7 home premium.
Cheers and thanks

The MOST important thing to do is to install the driver that comes with the cable FIRST! DO NOT plug it in until you reboot. As insurance against the wrong driver getting installed I disconnected my computer from the internet just so there was no chance Windows 7 could go looking in its internet cloud of drivers repository and would use only the driver you installed from the CD. When it is time to plug the cord in plug it into a USB port that you can alway use with that cable. Windows 7 likes to change the COM port assignment when you use different USB ports. Once you plug the USB cable into the computer you can go to the Device Manager and look for your cable's name on the device tree. If you right click on the cable branch, you can see what COM port it has been assigned. You will need that when you run the QSP programming software. Connect the radio before running the software. Once you've taken these steps then try to read from the radio first. If your brother has successfully used the software in XP, he can further assist you. If you get stuck, ask here.

Milton, list owner.

A friend imported the frequencies he had stored in the Chirp software from a different radio right into the 5888. Said it worked great and he had over 100 freqs and tones.

Turn the channel encoder to the desired frequency. Or enter it
with the dtmf pad. But it will reset back to whatever it was if
you go back to the channel mode.

The home channel goes back to what it's preprogrammed to.
I think they are 145.150 and 400.125. Keep in mind that these
are Land Mobile Radios and while they act like an amateur
radio not all aspects of the radio follow that convention and
the home channels is one aspect that doesn't conform to conventional
USA band amateur radios that have the ability to program your home
channels for say the national simplex calling frequencies. You can however
set up a couple hyper memory channels to serve as home frequencies
that you can instantly access.

Thank you for all the info, Milton. I was wondering if maybe there is a way through the Anytone software, to actually set up the frequency (with any off-sets, PL tones, etc.) to whatever we want the HOME frequency to default to?

I tried to edit two of the 5888UV files to see if I could set the Home to whatever I wanted, but I was not smart enough to figure out where the Home data is actually stored. So far No Joy!

Unfortunately not at this time unless you store them
in hyper memory banks. I think accessing hyper memory
is just a matter of pressing one button or knob but I don't
remember which. In the QPS5888UV softer there is a
sub menu for adding I think up to 4 frequencies to
hyper one and two. And you should be able to enter shifts
and tones for them. It's seems a good alternative.

It's likely stored in read only memory. I think you'd agree
that setting up some home channels for instant access in
hyper memory is a decent alternative.

Subject: [Anytone_AT-588UV] Re: How can we set the HOME frequency?

I tried to edit two of the 5888UV files to see if I could set the Home to whatever I wanted, but I was not smart enough to figure out where the Home data is actually stored. So far No Joy!

I agree, that IS a good alternative. The only reason I wanted to know if the HOME frequency could be saved to whatever the user wanted it to be, was that the HOME frequency is an option to program onto any of the 4 (PA-PD) programmable buttons on the Anytone's microphone, but unfortunately, the HYPER channels can't be programmed onto those buttons.

1990. Re: [Anytone_AT-588UV] Re: How can we set the HOME frequency?

Yahoo group: Anytone_AT-588UV
Date: 2013-07-11 23:31:39 UTC
From: Milton Hywatt
Topic: 1978 Message: 1990

Yes it is a disadvantage not to be able to program a mic
button for hyper. But my radio head is well within reach
and it isn't a hassle for me. Also I don't drive around much
and talk except for two repeaters, one VHF and one UHF.
On occasion I might flip over to three other VHF repeaters
but they are right up front in memory. I also listen to VHF
public safety. One day I was talking on the left side of the radio
and on the right side was a VHF police channel for my home town.
As a precaution, I always disable transmit for public safety channels
but the last time I added some frequencies I must have done something
to reenable transmit on this frequency. Since the A/B button can't be disabled
I wound up on the public safety frequency signing off with my call and
my name. Luckily they operate full tone squelch so they wouldn't have
heard me. And I do know one dispatcher because he lives right up the
street. I asked him if he heard anything on the repeater output and he
said no. So for those in a situation that also like to monitor police, fire,
EMS etc.. make sure you disable TX using the QPS software.

Just thought I'd add that little tidbit.

Thanks for sharing, Milton. As a result, I will make sure to disable any police/fire frequencies, with the Anytone's software, so as not to accidentally transmit. Thanks again!

Carlos

1992. OFFSET Bug? 5 kHz STEP causes SHIFT problems

Yahoo group: Anytone_AT-588UV
Date: 2013-07-14 20:02:07 UTC
From: kn4aq
Topic: 1992 Message: 1992

Anyone else seen this?

On a 5888, if I set the STEP (SET 03) to 5 kHz, it causes the SHIFT range (SET 36) to become very limited - 0.575 to 0.5937 if I twist the knob DOWN first, or 0.625 to 0.6437 if I twist the knob UP first.

Changing the STEP to values above 5 kHz restores the ability to adjust the SHIFT through its normal range.

73,
Gary KN4AQ

I don't recall seeing it. But just trying to dumb it down a bit. If you change the channel step to 5 khz, the repeater shift isn't capable of the standard shifts of 5 mhz for UHF and .6 mhz for VHF? What if the automatic repeater shift is on?

Subject: [Anytone_AT-588UV] OFFSET Bug? 5 kHz STEP causes SHIFT problems

Anyone else seen this?

On a 5888, if I set the STEP (SET 03) to 5 kHz, it causes the SHIFT range (SET 36) to become very limited - 0.575 to 0.5937 if I twist the knob DOWN first, or 0.625 to 0.6437 if I twist the knob UP first.

Changing the STEP to values above 5 kHz restores the ability to adjust the SHIFT through its normal range.

Hi, Milt,

That's correct, at least for VHF (I haven't tried UHF). Can't hit 600 kHz once the SHIFT has been adjusted away from that and get's "stuck." Just setting STEP to 5 kHz won't screw up the 600 kHz SHIFT until you actually dial away from it, then find you can't get very far, but you also can't get back.

Just tested ARS. Even if ARS is ON, if I set the STEP to 5 kHz and adjust the SHIFT so that it's stuck off of 600 kHz, a two-meter frequency will have the bad offset, and I can't get back to 600 kHz until I put the STEP above 5 kHz.

ALSO...
I noticed that the STEP of frequencies inside the SHIFT function equals what's set in STEP for VFO frequencies (eg. a 15 kHz STEP for the VFO will cause the SHIFT frequencies to change in 15 kHz increments). EXCEPT if the STEP is set to 6.25 kHz!

If STEP is set to 6.25 kHz, the VFO steps work fine, but inside SHIFT the steps UP are 5 kHz, and the steps DOWN are 10 kHz.

I haven't tried other STEP/SHIFT combinations because my fingers are getting tired of twisting the knobs.

Ah, programming...

73,
Gary KN4AQ

Very odd that the channels step and the repeater shift would follow each other. I guess I have no good reason to see the two linked. Sure appears to be a bug to me. Now, if using software it's likely that this is an issue, probably with setting the step and shift by hand. I suppose if you set the channel step to 10khz that's good enough for resolving 600khz shifts with steps in even amounts up to 50 khz. Just curious what were you trying to accomplishing using 5 khz steps?

>what were you trying to accomplishing using 5 khz steps?

Here in the Eastern US, two-meters has two different "channel steps" - 15 kHz above 146 MHz, and 20 kHz below. 5 kHz is the only common denominator between the two. So if you're going to use the VFO and move between band segments, you either have to be at 5 kHz, or keep changing the step in the SET menu.

Linking the VFO steps and the SET/SHIFT steps has some logic to it, but it wouldn't be absurd to not have them linked, either. I'd like to see the SET/SHIFT value be direct-entered using the keypad, like the VFO is.

From: CG
Topic: 1998 Message: 1998

Does the Anytone colored LED display have to remain on at all times? Is there anyway to set the radio for the lights to only turn on when receiving or transmitting?

Well John I ---guess--- that makes sense. Lessens the menu list where they can. I too had no idea #3 wasn't available in channel mode. In the VFO mode were you able to select all those step increments I listed below and if so did you see if 5 khz changed the repeater shift so you couldn't manually select .600 khz? I wanted to try it yesterday but had some other work to do outdoors in 93F temperature. That sapped my energy so I cam in and showered and fell asleep. I think I'll give what Gary was trying to do a try on the old and new radio and then make a new comment. Not so hot out today. at 2:30 it was only 90F. lol

Unfortunately no there is no setting. My Baofeng F-1 will do it. You can set it to display three different colors. One color when receiving, another while idle and there is a time you can set up to 10 seconds for the idle light to remain on. And there is a color you can set for transmit. I guess for some it would be cool to set the AT588UV up like this but again there is no setting published for it.

Does the Anytone colored LED display have to remain on at all times? Is there anyway to set the radio for the lights to only turn on when receiving or transmitting?

2002. Can the head separation cable also be used as a cloning cable?

Thanks again for your reply, Milton. I too have the Baofeng, and I figured since the Anytone was also a Chinese radio, that perhaps maybe the Anytone's LEDs could also be programmed to work similar to the Baofeng. Not a problem though, as I love this dual-bander so much, that such an option would only have been a nice extra...It would've been nice if such an extra could've been added through the software, but like I said, not a problem. I love this great dual-bander!

It says in the accessory list that the CP52 separation cable can also be used for cloning so yes, that works. Or just a standard CAT-5 jumper.

Thanks for keeping me on my toes. This is one area I haven't
put any thought into but a quick check in the owners manual
states verbatim: 3 meter extending cable for attachable
panel/Cloning Cable (PC52)

I've verified a standard Cat-5 jumper will work as an extending cable
so it will work for cloning also.

2008. Step + Shift weirdness confirmed

Yahoo group: Anytone_AT-588UV
Date: 2013-07-16 23:38:55 UTC
From: Milton Hywatt
Topic: 2008 Message: 2008

I haven't tried this on my newer radio but I have
one of the original 30 shipped to the USA with
the speakermic. #19 if the serial number indicates
that the last 5 numbers 00019 mean it wast the 19th.
And that is the oldest of at least 3 firmware revisions
I know of. It works great as a base unit even with a high
gain dual band AR270B Cushcraft with the tip of the antenna
at about 40 feet. I've worked other base units with omnidirectional
antennas at close to 100 miles to the north, the terrain is pretty
flat. To the south about 70 miles is my further simplex contact
because the terrain is ore hilly. Ok back to the weirdness...

Setting #3 the step in VFO mode to 5KHZ just about kills
any function of item #36 Shift. It was at .600 and as I rotated the
encoder knob it immediately jumped up to 99.9xxx MHZ. When
rotated CCW it only follows 3 clicks of the knob then stopped.
same goes for CW rotation or pushing the up down button on the mic.

Now going into the channel mode I was presented with just about the same
thing but I found that it would keep moving down from 99 MHZ but not up.
Of course this is just a temporary change that goes away when you cycle
the power and it goes back to .600 in the VHF band. I didn't try it with UHF.

Setting the step back to 10 KHZ alleviated the bug. I didn't try other steps.
However with all the selections of shift steps you shouldn't need to use 5KHZ
to come up with an odd shift other than .600 KHZ should you. Just off the top
of my head I can't think of one. And I'm going to try this in the newer radio
serial #00285 maybe later tonight

Milt.

From: Rick
Topic: 1407 Message: 2012

What is the recommended selection (wide, middle, or narrow) for typical amateur radio VHF/UHF FM work?

When I program the radio using the QPS software, is there a field selection to ensure the correct bandwidth of the transmitted signal?

In MARS the standard is shifting to narrowband FM. I can see how to select this (NAR) in the VFO mode, but how do I ensure in the memory mode that the radio is set for narrow?

Thanks. Still learning.

Topic: 2013 Message: 2013

Trying to get a definition of "normal" behaviors for this radio.

When I initially turn on the radio, it emits a BEEP at the end of the initialization that is a pretty harsh click/raspy beep instead of a nice tone. [is this a normal sound?]

Volume control --- the first 30 degrees or so of rotation are very quiet; then it reaches a magic point where the volume is suddenly loud (and gets louder with continued clockwise rotation of the control). Is the first 30 degrees of quiet, typical?

Commercial and Public Safety frequencies were required to switch to narrow band (12.5 KHz) no later than January 1st of this year. This change does NOT effect amateur, weather, or GMRS frequencies.

For amateur use, you should program wide. For any commercial or public safety use (from 150 MHz to 500 MHz) you must program narrow.

Raspy beeps are typical I suppose. Both my radios do it. And both radios are of different firmware versions. I've heard others who have described their volume as behaving the same as yours. It's not typical. The radio transferes every input through the removable head via serial data. The volume controls are not wired into the audio circuitry but rather their
positions are interpreted by the forward micro controller then sent to the radio where the data is read by the aft micro controller and applied to the audio circuity. I suppose changes in
firmware made since your radio was made might better the response of the control. How old of a radio do you have, last 4 digits of the serial number would give me an idea.

Using Chirp software, you would have to make those settings on a channel by channel basis. It is the "Mode" column, where you can select "FM" or "NFM". I believe it defaults to "FM", so if you program anything outside of the ham bands you would need to change that variable.

What operating system are you using?

Have you installed the driver for the programming cable?

Looks like one of four possibilities. #1, Wrong driver for your programming cable, most cables
will start a process on the PC that will start a search for the best driver. If you don't interrupt
that and tell the process to install the driver that came with the cable. chances are it won't
work. #2, you didn't realize the cable needs a driver to emulate a COM port or don't know
what a COM port is. #3, the correct driver was installed correctly but you didn't finish
the programming software installation by telling the programming software what com port
it is emulating. #4, you don't know how to determine what COM port the cable is emulating.

Ok read over the above and let me know if any four of the scenarios describe you. Also include
your operating system in your reply. Then myself or another member might be able to walk
you through the cable installation and then telling the programming software what COM port
the cable emulates. Until then not much help can be offered.

2024. Cross Band Repeating

Yahoo group: Anytone_AT-588UV
Date: 2013-07-26 13:24:02 UTC
From: n7kuw
Topic: 2024 Message: 2024

Just wanted to post a quick comment. Yesterday I used my 5888 to support a cross-band repeat operation where in the past I've used two land-mobile radios cross-connected. The 5888 worked beautifully. It was set up with both bands running 5 watts (low power), had a small 12 volt cooling fan (computer fan) mounted a few inches away to move air over the back end of the radio, and was hooked up to a 12 volt battery. The radio ran somewhere between a 60% to 70% duty cycle (very heavy use - i.e. one side or the other was actually transmitting over 60% of the time) for about 8 continuous hours. The ambient temperature in the operating area went from about 60F to over 80F during the 8 hour period. I was impressed with how well the radio worked. Both bands were tone guarded (on different tones), and the radio properly stripped the incoming tone before passing the audio to the other band.

So if you have a need for this type of operation, perhaps my experience will help in your consideration of this particular radio for the task.

No, think about it, How can an antenna transmitt (and receive) on the
same frequency band at the same time (with out an exceptional set of
directional can filters). Many times the cost of your radio...

When you are cross banding, you are using a two frequency antenna. ok?

I own two 5888's One is primarily used for cross band to a repeater I have trouble getting on an HT. I keep the power down to 5 watts, that does the job for one net on Tuesday at 6pm which usually ends at 7:30. So the radio transmits continuously on 70 centimeters except when I check in and if I have traffic for the net. Other than that it's about an hour of checkins and traffic, and half an hour of Amateur Radio Newsline. At 8pm there is another net, this one the repeater is about 55 miles away. So I bump the 2 meter power level to 20 watts. This net has Swap and Shop where you can buy, sell, trade, am and computer gear. The net is usually about 45 minutes and for this net I do place a 120mm computer cooling fan atop the radio because the built in fan isn't enough. But for 5 watts of continuous operation the built in fan seems to do a fine job. I've torture tested this radio. Transmitted high power continuous into a 1000 watt dummy load. After about 8 minutes the heat sink is too hot to touch. And the power starts dropping. I suppose there is a circuit that monitors the heatsink and then starts cutting back the drive to lower the output. My HF rig has that circuit also. So yes the radio RF deck does seem to be fairly rugged. And the radio works very well cross band. And I have taken a couple drops of silicone rubber and fixed the 120mm fan to the top so it now runs for both nets. And I haven't tried it yet but I bet the radio could transmit 50 watts into a dummy load for hours with that big fan atop. It's nearly as wide as the radio.

One radio says Intek on the bezel and one says Anytone.
There may be some slight differences in the firmware
but I wouldn't see why.

I allow the owners of the Intek badged radio to join this group
since the radios are likely identical in every aspect except the
name.

I believe both radios are made by Qixiang Electron Science and Technology Ltd.
It's not uncommon to see one manufacturer sell their goods to another. One example
was a VCR I owned back in the days of Beta format. It was made by Sony but was
branded by Zenith. Looked identical to the Sony model. And as time went on I've
come across other electronic goods manufactured by one company and then sold by
another and renamed. And these companies typically do not manufacture on their
own certain types of electronics, or might not manufacture any at all. Intek may be one
that
does not manufacture any radios. And as far as buying an Intek or Anytone anywhere
in the world goes, it depends if there is an importer that is buying them to resell.

Here is some Information regarding the AT-5888UV & identical units with other model numbers..
Here in the USA, in the paperwork submitted for FCC approval, Anytone listed the following possible Model Numbers for the radio, with a note stating: " Model Differences: All the Same except for Appearance "
5888UV, 5889UV, 5888UV1, 5888UV2, 5888UV3, 5888UV4, 5888UV5, 5888UV6, 5888UV7, 5888UV8, 5888UV9, DB-750X, HR-2040, DB-50M .

The DB-750X "version" of the AT-5888UV , with the same FCC ID, Has just arrived in the USA, & has a cosmetically different faceplate & microphone, but is otherwise an AT-5888UV. It sells generally for a slightly higher "street" price that the 5888UV & is a "Powerwerx DB-750X" only avalable thru that company, & their sub-dealers.
There is probably a chance over the next few years that there will be some of these other models with slight appearance changes ending up on the market.

For Fire/Rescue we use the standard Motorola 2Tone paging. Would like to program the unit to set up a channel to be silent unless a 2Tone broadcast is received. The manual is not all that clear on how to set it up. Has anyone actually tried it yet? Also, how would you reset the channel once it is activated by the tone.

I'm 99.9% sure the radio will not decode DTMF or two/five tone
for squelch purposes.

For Fire/Rescue we use the standard Motorola 2Tone paging. Would like to program the unit to set up a channel to be silent unless a 2Tone broadcast is received. The manual is not all that clear on how to set it up. Has anyone actually tried it yet? Also, how would you reset the channel once it is activated by the tone.

I have not tried it but I think 2or 5 Tone will work if you setup the proper Decode under 2 or 5 Tone Decode and then set Optional Signalling ON in Normal Channel Edit and then go to the More Column and double click and setup Optional Signalling and Squelch Mode to Option Signaling. That should cause the 2 or 5 Tone call to break squelch and otherwise be silent.

Ok then get busy! You probably know the software the best of anyone lol.

I thought of it after I replied and said to myself why would Anytone
only offer 2/5Tone encode? I have two radios, maybe I need to get
off my butt and fire up the Windoze box and see if I can both radios
up for 2Tone encode and decode. A lot of our fire departments around
here still signal 2Tone so it is still popular. And I always want the user
to get the most out of their radio they can.

Thanks John.

2040. Antenna connection to AT-5888UV

Yahoo group: Anytone_AT-588UV

From: carlinm58
Topic: 2040 Message: 2040

Hello to the group.

I am a new member who has just purchased the AT-5888UV and have what might be a basic question - can I connect 2 antenna to the unit using a tee piece or do I need to use a switch.

Both antenna are Australian made: 1) 477MHz-tuned antenna for UHF CB in Australia; 2) 25-1300MHz wide band scanner antenna with transmit capability on 40MHz, 72MHz, 120MHz and 468MHz.

Any help appreciated.

One multi-band antenna that covers the bands you transmit on is best. Receive is not as critical as transmit. Tee is not the way to connect antennas. A properly designed splitter (antenna coupler)is what you want, but there will be loss with any such device. I use a 2m-440 Dual Band Diamond NR770 antenna and live with any mismatch on other frequencies and it works fine.

John and Milton,

Thanks for looking into it. There is a signficant number of volunteer FD, Rescue & Ambulance folks in the NE that would be interested in this unit, if it will decode a 2tone sent by a dispatch center.

Just as soon as things settle down around here I'm going to experiment with it. Been doing some
remodeling to our home that I'd like to get done. Around here the FD tones pagers that also receive
voice audio. We don't have stations with living quarters so the paid and volunteer personel can hear
what the call is about. This is the way the township operates. Here in the city the calls are broadcast
on the PD, UHF FD and 800 trunked. Again we only have one station, no live in personel. I've never
heard any public service voice communications that was using 2Tone for two way communications.
The 2 x 2Tone (two sets of 2Tone) are different tones for different stations in the township. So the right
responders assigned to each station get called. But on the same frequency voice communications with DCS
squelch occur between the dispatch and responders. So the two way communications using 2Tone is
new to me. Hopefully one of use could have an answer soon. Or maybe another could chime in. It's
going to take someone with two radios that can do 2Tone. Doesn't matter if one is an Anytone and
one is a Chinese HT. I think both my Wouxun and Beofung do 2Tone. One thing, is this going to involve
a response from the mobile radios using 2Tone or is this stricly going to be like receiving a voice page?
In other words you're just going to need to decode the tones and open the squelch to receive the voice
on the other end, you won't be transmitting back. Not that this couldn't be done, but I don't see a need
for it.

You would need to use a proper antenna switch. One other possibility is to use a duplexer covering UHF on one side and 1.6 to 150 mhz on the other. Diamond makes such a beast, the MX72H. You would need in addition two SO239 barrel connectors since the LPF and HPF I/O of the duplexer terminates in a PL259. And for the input from your radio, you would need a short PL259 jumper from the radio to the duplexer as its input in this case would be an SO239.

While this should work, you would be much better off with a single broadband VHF/UHF dual band antenna. Comet makes the CA-2x4SR for land mobile radio.

I purchased the comet CA-2x4SR nmo when I installed my anytone mobile and
its a great match. Low swr and excellent tx and rx reports. Cheapest place
I've found the sr was cheapham.com

I wonder who is the target customer for this kind of a radio (DB-750X) ?

Do you have in the US any professional users who work on VHF and UHF bands
at the same time ?

If so, why for example Motorola/Vertex/Icom/Kenwood have not come up with
VHF/UHF equipment so far ?

Regards,

Paul

Subject: [Anytone_AT-588UV] Re: AT-5888UV vs. Intek HR-2040

Here is some Information regarding the AT-5888UV & identical units with other model numbers..
Here in the USA, in the paperwork submitted for FCC approval, Anytone listed the following possible Model Numbers for the radio, with a note stating: " Model Differences: All the Same except for Appearance "
5888UV, 5889UV, 5888UV1, 5888UV2, 5888UV3, 5888UV4, 5888UV5, 5888UV6, 5888UV7, 5888UV8, 5888UV9, DB-750X, HR-2040, DB-50M .

The DB-750X "version" of the AT-5888UV , with the same FCC ID, Has just arrived in the USA, & has a cosmetically different faceplate & microphone, but is otherwise an AT-5888UV. It sells generally for a slightly higher "street" price that the 5888UV & is a "Powerwerx DB-750X" only avalable thru that company, & their sub-dealers.
There is probably a chance over the next few years that there will be some of these other models with slight appearance changes ending up on the market.

I already owned a Comet CSB 750A. PL259 mount. Looks like a very
well built antenna. And electrically it's SWR curve is pretty flat across
the bands. Highest is 1.8:1 on the ends of UHF but I've never adjusted it.
And It has enough gain that I worked a pretty high profile VHF repeater
from a hilltop nearly 100 miles away with almost full quieting. But that's
a really kick-ass repeater that I can work from a sweet spot in my back yard
with a 5 watt HT and I'm about 45 miles away. But anyhow yes I would recommend
the Comet CA2x4SR just on the merits of the CSB750A construction.

Topic: 2029 Message: 2048

I guess the market is more towards giving the amateur licensee
a cheaper alternative than say a $500 Yaesu dual band radio. I notice
now for sale at $190 US is the HYS TC-VU55 dual band LMR radio.
Cost to ship from China as around $40. The radio has about the same coverage
as the Anytone, 136 - 174 / 400 - 480 both TX and RX. 50 / 35 watts.
So yes these radios are attractive to the newer ham operators on a budget.
And they may be attractive to a fire department, police department or other
public service agency in a small town. I don't know why Kenwood, Motorola
GE, Hytera don't make dual band radios except possibly they feel the performance
is compromised over a single band radio.

I wonder who is the
target customer for this kind of a radio (DB-750X) ?
Do you have in the USany professional users who work on VHF and UHF bands at the same time
?
If so, why for example
Motorola/Vertex/Icom/Kenwood have not come up with VHF/UHF equipment so far ?
Regards,
Paul

Subject:[Anytone_AT-588UV] Re: AT-5888UV
vs. Intek HR-2040

Here is
some Information regarding the AT-5888UV & identical units with other model
numbers..
Here in the USA, in the paperwork submitted for FCC approval, Anytone listed
the following possible Model Numbers for the radio, with a note stating: "
Model Differences: All the Same except for Appearance "
5888UV, 5889UV, 5888UV1, 5888UV2, 5888UV3, 5888UV4, 5888UV5, 5888UV6, 5888UV7,
5888UV8, 5888UV9, DB-750X, HR-2040, DB-50M .

The DB-750X "version" of the AT-5888UV , with the same FCC ID, Has
just arrived in the USA, & has a cosmetically different faceplate &
microphone, but is otherwise an AT-5888UV. It sells generally for a slightly
higher "street" price that the 5888UV & is a "Powerwerx
DB-750X" only avalable thru that company, & their sub-dealers.

There is probably a chance over the next few years that there will be some of these other models with slight appearance changes ending up on the market.

From: n7kuw
Topic: 2029 Message: 2049

There are some very high end ($5000+) radios that are multi-band land mobile radios. In general though, there is virtually no demand for that capability. A company, or entity (such as fire department, city, etc.) will typically license in a single band. In a few cases, interoperability with neighboring services (e.g., fire dept in the next county) will require having more than one band, but that market is too small to get most of the manufacturers to develop multi-band product.

Almost without exception, a dual or multi-band radio is going to have worse selectivity, and will be more sensitive to intermod, than a single band radio. That's just basic rf engineering, you can design for wide receive capability or for high selectivity, but it is hard (and costly) to do both.

The Anytone (and Powerwerx, et all) radios tend to match specs with most dual band amateur radios, but tend to not match specs with most single band commercial radios. That is one of the tradeoffs you must be willing to accept when you go for the low-cost "does it all" radio. That isn't to say the Anytone (et all) is bad, it has it's place and will serve many people quite well. But there are those whom it won't serve well.

The land-mobile radio marketplace is evolving. I'm not sure yet whether that is good or bad. Many end users are now the people who are programming and placing radios into service, and unfortunately in many cases they are not doing so in compliance with the license requirements (they are probably not even aware of the license requirements). Sooner or later, the FCC is going to make an example of someone. Some poor volunteer fire department or similar agency is going to end up with improperly programmed radios operating under their license, and take a hit. Commercial and public safety are radically different from amateur with regard to licensing, equipment and antenna requirements, etc. You can't just add a radio to a system (the license specifies how many are allowed), or increase the power (the license specifies how much, or little, is allowed), or even change an antenna (the license probably specifies ERP), without knowing what the license permits and knowing what you are doing. Therein lies the challenges with the flood of low cost, end user programmable, Part 90 certificated radios. And with a radio like the Anytone, if you program it and leave it with the ability to operate in VFO mode, it is no longer Part 90 compliant. You've got to lock out the VFO mode in order to do Part 90. So that rather significantly limits the usefulness of the radio for amateur purposes.

From: carlinm58
Topic: 2040 Message: 2050

Thanks for all the responses, they were what I was expecting. I just needed to rule out the tee piece connection.

I have now decided trying to work with the Chines radios in Australia is too much of a hassle, as they are not compliant and the manufacturers are not keen on undertaking additional costs to have them tested. So I am selling my radio without it being taken out of the box. If anyone is interested, I have listed it on eBay as Item No. 221261389948.

2051. Re: AT-5888UV - Receiving a 2tone / 2t alert (page)

Yahoo group: Anytone_AT-588UV
Date: 2013-07-30 13:24:42 UTC
From: yvsar
Topic: 2034 Message: 2051

I may have confused things. We operate in a similar approach as you indicated. We have a voice frequency (VHF repeater/commercial/TPL) assigned to the ambulances in the area. They can talk to the dispatch center or unit to unit on that and other frequencies. For emergency calls, dispatch issues a 2tone alert for the ambulance it needs followed by a voice message. The ambulance and responding personal notify (via voice on the same frequency) that they are responding, onscreen, etc.
I am simply trying to set one memory channel on the AT-5888UV/AT-588UV to act like a 2tone voice pager. I know the VHF frequency, the TPL used, and the 2Tone frequency used. Would set up one side of the radio for it (act like a pager), and the other side for scanning or to talk on. For this memory channel, the goal is for it to stay silent (doesn't open up for normal communications) until a 2tone is received from dispatch. Upon receiving the 2tone, it opens up that memory channel to listen to the voice messages. The goal is for it to stay open until I do a reset, or at least for an extended period of time.
I am trying to find out, if anyone has actually been able to set up the AT-5888UV/AT-588UV to receive a dispatch center sent 2Tone, what radio settings are need to be configured, how long does it stay open after receiving a 2Tone, and how does one reset that channel to silent.
Thanks for your support.

From: n7kuw
Topic: 2034 Message: 2053

While I have not actually tried this, looking at the programming software there is a 2Tone tab. You would need to go into that tab and define the 2-Tone tones and durations, etc. Once that is complete, go into the channel programming and set Optional signalling to on, then double click the "More" column and set Optional Signalling to ON and select the 2Tone memory slot you programmed the tones into. Finally, in Squelch Mode set it to either Optoinal Signalling, or to CTCSS/DCS and Optional Signalling.

Leave that channel selected in your display, and when the applicable tones are received it should open squelch. I would speculate that you would probably have to go off channel and back on channel to reset it, or possibly use the TV/SQL button to reset it. I'm sure if you play around with it a bit, you can sort out the details.

Let us know if/when you succeed with what actually works and how you set it up.

--- In Anytone_AT-588UV@yahoogroups.com, "yvsar" <e.j.hutchinson@...> wrote:
>
> I may have confused things. We operate in a similar approach as you indicated. We have a voice frequency (VHF repeater/commercial/TPL) assigned to the ambulances in the area. They can talk to the dispatch center or unit to unit on that and other frequencies. For emergency calls, dispatch issues a 2tone alert for the ambulance it needs followed by a voice message. The ambulance and responding personal notify (via voice on the same frequency) that they are responding, onscreen, etc.
> I am simply trying to set one memory channel on the AT-5888UV/AT-588UV to act like a 2tone voice pager. I know the VHF frequency, the TPL used, and the 2Tone frequency used. Would set up one side of the radio for it (act like a pager), and the other side for scanning or to talk on. For this memory channel, the goal is for it to stay silent (doesn't open up for normal communications) until a 2tone is received from dispatch. Upon receiving the 2tone, it opens up that memory channel to listen to the voice messages. The goal is for it to stay open until I do a reset, or at least for an extended period of time.
> I am trying to find out, if anyone has actually been able to set up the AT-5888UV/AT-588UV to receive a dispatch center sent 2Tone, what radio settings are need to be configured, how long does it stay open after receiving a 2Tone, and how does one reset that channel to silent.

Pretty much my feelings also. I guess our city isn't normal because the FD operates on 155, 462, and 800 APCO digital trunk. The EMS is pretty much strictly trunked while the FD still uses 400 for mobile to mobile and base to mobil. And I'm not quite convinced the 5888UV can't be locked where it cannot be programmed. I think there is a password setting for programming but don't hold me to that comment, I'll have to fire up the software. I do have both my radios set to use a bootstrap password, the radio will not boot until you enter your code on the DTMF. Yes I know that's not anywhere near disabling programming but I thought I'd mention it. Would keep the curious fingers from operating the radio. Well I have two projects to test, the 2Tone squelch and see if I can find a password function to prevent programming from the radio or using software.

Subject: [Anytone_AT-588UV] Re: AT-5888UV vs. Intek HR-2040

There are some very high end ($5000+) radios that are multi-band land mobile radios. In general though, there is virtually no demand for that capability. A company, or entity (such as fire department, city, etc.) will typically license in a single band. In a few cases, interoperability with neighboring services (e.g., fire dept in the next county) will require having more than one band, but that market is too small to get most of the manufacturers to develop multi-band product.

Almost without exception, a dual or multi-band radio is going to have worse selectivity, and will be more sensitive to intermod, than a single band radio. That's just basic rf engineering, you can design for wide receive capability or for high selectivity, but it is hard (and costly) to do both.

The Anytone (and Powerwerx, et all) radios tend to match specs with most dual band amateur radios, but tend to not match specs with most single band commercial radios. That is one of the tradeoffs you must be willing to accept when you go for the low-cost "does it all" radio. That isn't to say the Anytone (et all) is bad, it has it's place and will serve many people quite well. But there are those whom it won't serve well.

The land-mobile radio marketplace is evolving. I'm not sure yet whether that is good or bad. Many end users are now the people who are programming and placing radios into service, and unfortunately in many cases they are not doing so in compliance with the license requirements (they are probably not even aware of the license requirements). Sooner or later, the FCC is going to make an example of someone. Some poor volunteer fire department or similar agency is going to end up with improperly programmed radios operating under their license, and take a hit. Commercial and public safety are radically different from amateur with regard to licensing, equipment and antenna requirements, etc. You can't just

add a radio to a system (the license specifies how many are allowed), or increase the power (the license specifies how much, or little, is allowed), or even change an antenna (the license probably specifies ERP), without knowing what the license permits and knowing what you are doing. Therein lies the challenges with the flood of low cost, end user programmable, Part 90 certificated radios. And with a radio like the Anytone, if you program it and leave it with the ability to operate in VFO mode, it is no longer Part 90 compliant. You've got to lock out the VFO mode in order to do Part 90. So that rather significantly limits the usefulness of the radio for amateur purposes.

The only thing I could see a problem with is UHF citizens band. Here in the states citizen band is 29.965 - 27.405 AM USB/LSB. Not sure about FM.

Is your UHF CB operating on FM? And as far as the rest goes with coverage from 136 - 172 tx and rx and 400 - 520 tx and rx with wide or narrow, a lot of choices for channel steps, what else isn't compatible? I'm just curious.

Thanks for all the responses, they were what I was expecting. I just needed to rule out the tee piece connection.

I have now decided trying to work with the Chines radios in Australia is too much of a hassle, as they are not compliant and the manufacturers are not keen on undertaking additional costs to have them tested. So I am selling my radio without it being taken out of the box. If anyone is interested, I have listed it on eBay as Item No. 221261389948.

The pinout is in the user's manual on page 10. My guess is pin 8 (serial data) and pin 1 (ground) are used for programming and cloning.

TXD and RXD lines out of the UART are combined into one channel
or connection I suppose. I don't mess with the stuff so I don't know if
you just connect the two together or use a couple 1N4001 diodes.

If you go to Google and use the keywords "prolific 2303 single line wiring"
you might find the answers. That chip might have some sort of mixer built
inside it to have just one line out but like I said I don't mess with the hardware.
I do know someone I could ask who has built cables before if you can't find
what you are looking for on your own.

I sense some confusion here. The Pin 8 on Page 10 is for Keypad Serial Data, not Programming data. I believe the previous cable poster was using 568B Cat5 wiring colors and if so, then Mic Connector Pin 1 is GND, Pin 2 is Rx Data, and Pin 3 is Tx Data. These programming connections are not shown in the manual.

From: Milton Hywatt
Topic: 1576 Message: 2062

If you will re-read the wording I used was MY GUESS. However as usual, my GUESS was educated. Looking at the clear see through 8P8C connector you will find only TWO connections
are used, 1 and 8. Pin 1 has a white wire and pin 8 a black. So no there was no confusion John,
at least not on my part.

I knew it from looking at the 8P8C connector on the cable and it only having
two wires one on 1 and one on 8. I might however have the colors backwards
but that's not an issue. What flows into the radio as serial data from the mic, is the same
data
used by RS232 to program. My only question is how do you combine txd and rxd on one line
at the UART? Or does the UART have one rxd/txd line in?

yes that was http://www.nevadaradio.co.uk/ now they are helpful but want to charge me the £15 for the new disk and cable I don't need that I have all that,

just need that one program

I have the programming software QPS588UV_1.00 but its not that its called something else

regards

2068. RE: [Anytone_AT-588UV] Re: [Tutorial]Program Cable Pin-Out and Frequency Range Modification

Yahoo group: Anytone_AT-588UV
Date: 2013-07-30 23:03:48 UTC
From: Pawel Walaszczyk
Topic: 1576 Message: 2068

I am using commercially available solution which can be bought here: (<http://www.409shop.com/409shop_product.php?id=106794> http://www.409shop.com/409shop_product.php?id=106794) - I mean the "6-070 USB cable" - my part of the cable is that which is plugged in with 3.5mm jack.

The other solution is to use MAX 232, which interfaces 'RS232 side' with 'single line' side. I can provide a schematic of this solution as I also have been using that some years ago.

Regards,

Paul

Subject: Re: [Anytone_AT-588UV] Re: [Tutorial]Program Cable Pin-Out and Frequency Range Modification

I knew it from looking at the 8P8C connector on the cable and it only having

two wires one on 1 and one on 8. I might however have the colors backwards

but that's not an issue. What flows into the radio as serial data from the mic, is the same data

used by RS232 to program. My only question is how do you combine txd and rxd on one line

at the UART? Or does the UART have one rxd/txd line in?

Subject: RE: [Anytone_AT-588UV] Re: [Tutorial]Program Cable Pin-Out and Frequency Range Modification

Guys,

I made the programming cable by myself and it is working fine. I have Intek HR-2040 but as it was explained on this forum it is the same radio as AnyTone. So pin 8 (Keypad Serial Data) is used as Tx/Rx line and pin 1 as a ground.

Regards,

Paul

Subject: [Anytone_AT-588UV] Re: [Tutorial]Program Cable Pin-Out and Frequency Range Modification

I sense some confusion here. The Pin 8 on Page 10 is for Keypad Serial Data, not Programming data. I believe the previous cable poster was using 568B Cat5 wiring colors and if so, then Mic Connector Pin 1 is GND, Pin 2 is Rx Data, and Pin 3 is Tx Data. These programming connections are not shown in the manual.

Thanks and I apologize if I came back a little strongly accented.
I just got some mail order medications that were totally screwed
up and I probably should have waited to reply to you after I cooled
down. My damned insurance gave me an ultimatum to either copay
$10 a month for one medication I take regularly unless I mail order
3 months worth at a time. Well they sent me the wrong medication.
Even with someone else's name on it. So I was ready to skyrocket
through the roof because I knew crap like this would happen. But it
was no excuse to be heavy with you and again I apologize.

So it's good
to know the data gets combined on the USB tx and rx lines.
